THE AMERICAN FLORIST

America is "the Prow of the Vessel; there may be more comfort Amidships, but we are the first to touch Unknown Seas."

Vol. V.

CHICAGO AND NEW YORK, AUGUST 15, 1889.

With Supplement. No. 97.

THE AMERICAN FLORIST

Copyright, 1889, by American Florist Company.

Entered as Second-Class Mail matter.

Published on the 1st and 15th of each month by

THE AMERICAN FLORIST COMPANY.

Subscription, \$1.00 a year. To Europe, \$1.50.

Address all communications to

AMERICAN FLORIST COMPANY.

54 La Salle Street, CHICAGO.

SOCIETY OF AMERICAN FLORISTS.

FIFTH ANNUAL MEETING

AT BUFFALO, N. Y.

August 30, 21, 23, 1889.

WM. J. STEWART, Secretary, 67 Bromfield St., Boston, Mass.; M. A. HUNT, Treasurer, Terre Haute, Ind.

The annual dues of \$1. may be forwarded to either the secretary or treasurer before the meeting who will return a receipt and badge by mail. To this way you can materially lighten their labors at the convention and avoid delay in securing your badge on the opening day.

RAILROAD RATES—To secure the rate made by the passenger associations when going to the Buffalo convention this month you will pay full fare going and when purchasing your ticket ask for a certificate of such purchase from the agent selling you the ticket. This when countersigned by the secretary at the convention will be an order to the Buffalo agent to sell you a return ticket at one third fare. Ticket agents are supplied with blank forms for the certificates.

Don't neglect to secure one properly filled out when purchasing your ticket as otherwise you will not secure the reduced rate on the return trip. Orders for return tickets at the reduced rate will be good up to and including the 26th, three days after the final adjournment on the 23d.

FROM NEW YORK CITY TO BUFFALO.—The delegation from New York city and vicinity will leave from foot of West 42nd street at 4:25 p. m. and from foot of Jay street, North River at 4 p. m., August 19, for Buffalo, via the West Shore Railroad, over which special arrangements have been made to run a train to connect with the Boston party at Rotterdam Junction. This train will stop to take up delegates between New York and Buffalo at any station where they wish to get on providing notice is sent by letter or telegram to J. N. May, care ticket agent Weehawken Depot, New Jersey, before the train starts. Those wishing to secure sleeping berths at the reduced rate must send \$1.50 for each in advance to J. N. May, Summit, N. J., otherwise they will have to pay full rates for sleeping accommodation. Albany delegates leave Albany at 8:45 p. m. to join this train. Connecticut delegates will find it to their advantage to go direct to New York city and start with the crowd from there. All southern delegates who wish to go via New York will please report immediately as above and meet at the store of Peter Henderson & Co., 35 Cortlandt street, New York, not later than 3:45 p. m. August 19, where all who are going are requested to report at the above hour.

JOHN N. MAY.

RATES FROM PITTSBURG.—The Allegheny Valley railroad will sell excursion tickets from here to Buffalo and return good on any train going or returning until October 31, and good to stop off at Chautauqua returning, for \$10. They also sell a Niagara Falls excursion ticket for \$10 50, good on any train going, with privilege of stopping off one day at Buffalo going, but a month if holder wishes when returning. One of these might suit those who are going to the convention better than certificate plan.

ALEX. MURDOCK.

FROM BOSTON TO BUFFALO.—The delegation from Boston to the Buffalo meeting will leave at 3 p. m. Monday, August 19, via Hoosac Tunnel and West Shore railroad. New England members who wish to join should send their names at once to the secretary, W. J. Stewart, Boston, or to the vice president, L. H. Foster, Dorchester, and berths on sleeper will be reserved for them. Railroad fare for the round trip \$14 20.

FROM CHICAGO TO BUFFALO.—The Chicago delegation will leave via the Michigan Central R. R., at 3 p. m., Sunday, August 18. Those who wish to join

the party should notify G. L. Grant, 54 La Salle street, Chicago at once, and berths will be reserved for them.

New York Notes and Comments.

A week of constant rain has pretty well destroyed the outdoor flowers in many localities; if there should be a sudden rise in the market it is a question where any good stuff could come from. At this season the least increase in demand is at once noticeable, as, for example a recent large funeral, preceding which the mortuary chamber was beautifully and elaborately decorated for about a week. This caused a perceptible demand for good flowers at this season, though it would scarcely be noticeable in the winter. The fashion of beautifully decorating the death chamber instead of simply loading the casket with a profusion of meaningless designs, is certainly increasing in favor, as it deserves; it gives scope for fine work on the part of the florist, and is encouraging to the trade, after the melancholy "Please omit flowers," which follows so many obituary notices.

A recent trade event was Peter Henderson's gladiolus show, the largest and best he has ever held. It took place during the rainy week, and it was unavoidable that the wretched weather must affect it somewhat, yet the display was large and fine. The store on Cortlandt street was turned into an exhibition hall, the display monopolizing the usual counter space on either side and the center. At the foot of the center stairway was a fountain basin containing aquatics, including a well grown alligator, which smiled very expansively on the visitors. Owing to the rain the supply of lily blooms was limited, but a few caladiums and other plants made the fountain very pretty.

The best gladiolus were the lighter sorts, Shakespeare being particularly fine; there was a very good exhibit of the sulphur-colored sorts. The most interesting of these flowers was a new white, certainly the best so far exhibited. Of course it is not pure dead white—no gladiolus is—one can never expect to see the same absolute purity in this as in a eucharis, but it is really a good clear white, with a single pale violet line in the lower petal. The flowers have a very good substance, and the spike is fine. This flower has already received the Prospective prize of the Massachusetts Hort. Society; it will have to be exhibited three years in succession before it receives the final prize, and it has also received a certificate of merit.

The gladiolus formed the chief part of the exhibition, but cut blooms of Liliun auratum var. rubrum vittatum deserved special note; they were very large and richly colored, the red stripe being broad and deeply colored. They made the

other lilies seem very small. A few of the French cannas attracted notice, but the best place to see them is at the nurseries, where they look more gorgeous than Solomon in all his glory. They are par excellence, the plants for a conspicuous group or border, where the beauty of both flowers and foliage is fully displayed.

A large plant of *Crinum grandiflorum* in flower occupied a conspicuous place; palms and other decorative plants made a backing for the cut flowers. *Sabbatia chloroides* was an unfamiliar thing, with rosy lilac gentian-like flowers; several varieties of this plant were grown years ago, but the present generation carries little for this class of annual or herbaceous plants, unless they are very showy. Many of them are pretty, extremely so sometimes, but dealers settle their fate by the sententious words, "There's no money in them." Some of the dwarf Lima beans in pots made a curious exhibit; fauca a compact little plant like an ordinary wax or bush bean bearing real, bona fide Limas! A corner devoted to small conifers in pots gave quite a suggestion in decoration; there is no doubt that these plants have their place in such work. *Pinus excelsa*, the graceful Bhotan pine, Nordmann's silver fir, and the Rocky Mountain Blue spruce contrasted well in color, and the golden retinosporas were charming; they make such very gracefully shaped plants. The slender Irish yew, ordinary English yew, and the weeping hemlock made handsome pot plants. One would imagine that these little conifers would be desirable for standing in a hall.

A recent accession to the ranks of aquatic fanciers is Mr. Nash, the Clifton (N. J.) rose grower. He has added to his place a natural bayou connecting with Dundee Lake, where he will naturalize fine water lilies and lotus. Aquatics are increasing in favor, and certainly the best way to popularize them is for the florists to show what may be done with them. Any one fortunate enough to possess a bit of swampy ground may do a good deal in this direction.

Some fine tuberous-rooted begonias grown by Jas. Dean, of Bay Ridge, were recently noted. They were seedlings of the Roetzli strain, very large and as vivid in color as *Anemone fulgens*. The showiest class of begonias—admirable too for a shady border during the summer. The late J. Y. Murkland had a border planted with them, which attracted great admiration.

Jos. Towell, of Paterson, has gone to Europe to visit the great nurseries across the water. EMILY LOUISE TAPLIN.

New York Notes.

BY WM. FALCONER.

I'VE JUST BEEN to New York to see Peter Henderson's gladiolus show (July 31–August 2); and the "flowering" cannas were so pretty that I resolved to go right out to the nurseries and see them growing there, and so I went.

THE DWARF CANNAS occupied a wide and conspicuous belt of land and were planted out. Several beds beside Mr. H.'s house were also filled with them. They were in vigorous growth and in full bloom, and amply emphasized their claim to popular respect. They are everybody's flower just as much as is a gladiolus or dahlia. Every young growth bears a flower spike which rises well up above the foliage, and as the plants continue to throw up new shoots all summer long so they continue to bear blossoms.

I did not have time to note the several varieties Mr. H. cultivates, but as they seemed to comprise the cream of these cannas I will pass them now and refer in a separate article to these cannas in general.

ROSES, ROSES EVERYWHERE.—House after house is filled with them, some planted out on benches, some in pots and hosts in cutting beds. The plants in the cool houses are freely dusted over with tobacco powder, a no-you-don't to the greenfly. And slightly rotted leaves are spread thinly over the surface of the ground on the benches to check the drying influence of sunshine on the soil. The cutting beds are covered by lath-shadings raised a few inches above the beds and over this canvas is spread, and in bright weather kept continuously wetted by sprinkling with water.

THE NEVEST THING in roses is a "graft hybrid," if I may so term it. The stock was Marechal Niel and the scion Mermet. The "hybrid" differs from either, and Mr. Henderson thinks it resembles a Gloire de Dijon in habit more than anything else. It was not in bloom when I saw it, but the plants were very healthy.

LOTS OF WOOTTON are being grown and the plants are as clean and vigorous and healthy as can be, and the propagator's knife is unsparing among them.

AMERICAN BEAUTY is planted on the middle benches of one of his largest new houses, and they look fine. At one end all the plants are "worked," at the other end they are on their own roots. There isn't very much difference between them, but if anything the "worked" plants are the strongest.

A RED LA FRANCE is one of the new things among roses. It is hard to conceive that any change of color will improve the exquisite La France as it now is, but as we have a craving for different varieties and different colors, a red La France will be welcomed among us. Wish we could get a white one. Some years ago Mr. James Taplin called my attention to a red La France that he had secured, but I have not heard anything of it late.

A CLIMBING LA FRANCE is another form we shall gladly welcome. It was planted out on a bench, and in bloom. Its blossoms are just the same as we have in the ordinary bush form, but the plant is of unmistakable scandent habit.

COLEUS—the yellow-leaved *Verschaffeltii*. Not yet sure about a name or the name. In every particular except color it is the exact counterpart of *Verschaffeltii*, which it also resembles in freedom and habit of growth out of doors. The color is yellow tinged with greenish, and the veins reddish. Both are planted out side by side.

COLEUS BLACK DWARF is an exceedingly dwarf variety with almost black-crimson foliage. It was planted out in two places, in one it has grown very little, in the other and close by the first mentioned it has grown and matted vigorously and densely. If it does well what a grand and desirable associate it will be as a companion for almantheras in carpet gardening.

ONLY ONE COLEUS out of hundreds of seedlings raised here last year has been saved, and its fate is yet uncertain, as it has not been tested sufficiently. Its color is white with green fill.

THE PETUNIAS, double and single, were in good bloom and had just been repotted into their "flowering" pots. They were in a light greenhouse and meant for

seeding. Mr. Henderson saves his own double petunia seed, and reckons that it costs him at least \$300 an ounce.

FANCY-LEAVED CALADIUMS in pots fill up two or three of the larger houses. They are grown in summer and rested in winter. The little argyrites is a great favorite still. Mr. H. tells me that one of the finest collections of caladiums in the country is grown by Mr. Smith, gardener to Mr. Colgate at Yonkers, near New York. But caladiums are only one of the many things Mr. Smith has superior varieties of and grows in perfection.

SOMETHING NEW in plant stakes attracted my attention. They were wooden strips about 2 feet long, $\frac{1}{2}$ to $\frac{3}{4}$ inches thick and cut square, and clean and straight as an arrow. They are trimmings from some factory down in Maine and cost him a dollar a thousand. When received the bundles are stood on end in a tub of kerosene so as to thoroughly saturate the ends that are to be stuck into the ground and render them as indestructible as the top ends. Unless so steeped in some preserving material the ends stuck into the ground rot in a few months. They are the neatest stakes I have ever seen, and I believe as serviceable as the regular fancy wooden stakes one gets at the seed stores. He uses them for petunias and everything else of that size that needs stakes.

OF AMPELOPSIS VEITCHII (the south side ivy of Mr. Smith) he has handled 40,000 plants this season, and he assures me it is one of the most satisfactory plants he has ever grown or sold. Easily raised from seeds or cuttings. His stock is entirely pot grown. It can be propagated and grown out of doors in the open ground most as easy as in pots and indoors, but the trouble comes when we transplant them from the open ground. Most planters dislike to head back their newly transplanted ivies hence lose many. But in the case of pot plants heading back at transplanting time is quite unnecessary, and they may be transplanted with perfect safety summer or winter. And people are becoming alive to this fact.

MRS. ALPHEUS HARDY was, last year, the most precious of all chrysanthemums, but it promises to be plentiful enough this year. Mr. Henderson is getting up an immense stock of it. Its chaste beauty, distinctness and rarity riveted the admiration of every one who has seen it, and its praises have been sounded throughout the civilized world. But we are soon to have another surprise, namely:

A PINK COLORED "hairy" flowered chrysanthemum of the same style as Mrs. Alpheus Hardy. I have known of the existence of this pink-blooming variety for some time, but not till to-day did I know that it had escaped from its prison in Japan. But it has and Peter Henderson has got it. This is the second time he has had it; the first time every plant was dead when received. That horticultural veteran, Peter B. Mead, was telling me about it a couple of months ago. Mr. Mead's daughter was for several years a resident of Japan and officially connected with the royal families of the country. She used to treat her father here to descriptions and sketches of the hidden floral treasures of the princes' gardens, and laid particular stress upon this pink "hairy" flowered chrysanthemum. But she found it impossible to obtain a plant of it to send to her father at Mamaroneck. This shows how true is the proverbial attachment of the Japanese to their pet plants.

THE PARISIAN BASKET

THE STOCK PLANTS of chrysanthemums are grown in grocery boxes—the usual soap boxes, cracker boxes, and the like—and six plants to a box, and the boxes massed together in long belts out of doors. Each box is doubly labeled. This to a great extent does away with the inevitable mixing likely to occur, more or less, when the stock plants are grown in pots.

STORING EMPTY small flower pots.—

Instead of piling them away on benches and in bins they are laid orderly into moderately deep grocery boxes, and these boxes when full are stored one above the other in the sheds. New pots and dirty pots are treated in this way, but the sizes are restricted to 3 inch and under.

THE MEN were preparing soil in the yard. Instead of sifting it through wire sieves they were dashing it through gravel screens.

The Parisian Basket.

This style of basket is one of the best to advise for the stage or steam boat. The handle is very high which allows of a graceful arrangement of flowers; the basket illustrated being about three feet high. The large roses on the left are Mrs. John Laing; on the handle and extreme right are Brides, in the center and unfortunately in the shadow are "Jacqs."

As can readily be seen simply long

stemmed roses with their own foliage are used, no smilax, and only sufficient wire to fasten the roses on to the handle. This manner of putting such a profusion of roses on to the handle is very graceful and for the occasions mentioned it can be done very nicely, as it is the effect which is more desired than the lasting qualities at such times; but when baskets are sent to homes it is hardly advisable to treat roses in this manner, as it is to the florists' advantage to have his flowers last a reasonably long time. If you desire to put flowers on the handles of baskets (which often does add to their beauty), it is better to choose flowers that last better than roses.

H. H. BATTLES.

Cost of Production.

EDITOR AMERICAN FLORIST:—If your correspondents had carefully read the published extract from *Garden and Forest*, referring to the cost of production, they should have seen that it said only that *some* plants could be so produced. Nobody in their senses would say that geraniums, roses, etc., that require from four to five months to make plants could be produced at such prices, but that coleus, verbenas, heliotropes and seedlings of many things requiring but five or six weeks in the spring months to produce young, salable plants can be so grown, there is no question. Tens of thousands of roses grown in 3-inch pots are sold to the trade every season as low as \$4 per 100. In the market here and in other places, verbenas grown in 3-inch pots and staked up are sold at \$3 per 100, geraniums and fuchsias in 4-inch pots at \$6 and \$8 per 100, pots in nearly all cases when sold in the markets are included. A question to decide is whether six-weeks-old coleus and verbenas sold in May and June at \$10 per 1000, or roses six months old in 3-inch pots at \$4 per 100, geraniums and fuchsias in 4-inch pots at \$6 or \$8 per 100 (sold in the pots) are the most profitable. The florist having to sell at such prices in either case is not likely soon to become a millionaire, but from choice I would take the chance of occasionally "slaughtering" at auction at \$10 per 1000 (it is only rarely that we sell at such prices) rather than take the other. All such are grown in 2-inch pots.

PETER HENDERSON,

Jersey City, Aug. 3, 1889.

The White House Gardens.

In your issue of July 15 I see an article headed as above, which seems to me illiberal and not substantiated by the facts in the case.

I have always admired Head Gardener Pfister's taste in arranging plants and flowers, and while I doubt if he is responsible for the form of the large conservatory attached to the White House, it nevertheless seems to me to be well adapted to its purpose.

And it must be borne in mind that the plants in this conservatory suffer from the fact that for many months of the year they are constantly used for decorating the spacious apartments of the Presidential residence, which involves carrying them in and out several times a week, and at crush receptions they are not handled very carefully by the crowd. Only those who are frequently at the Executive Mansion can know how phoenix-like each morning fresh flowering plants line the corridors and ornament every table and mantel in the building. This constant moving of the plants must naturally militate against

any careful arrangement in the conservatory.

Your correspondent failed to mention the many rare plants maintained in excellent condition in spite of these disadvantages. In the rear of the greenhouses is a garden of old fashioned flowers which the present lady of the White House was not long in finding out when she arrived in the early spring. Here flourish Bleeding Hearts, Columbines, Larkspurs, Irises, Spiraeas, Sweet Williams, Peonies and other plants rich in association. The extensive grounds abound in flowering shrubs, ornamental trees and parterres of richly colored plants. To produce all this effect with only a limited appropriation of money from Congress requires much skill, energy and perseverance on the part of the person in charge.

Auburn, N. Y.

D. R. A.

Seasonable Notes.

From this time until the season of flowering is over eternal vigilance will be the price of good results.

Specimen plants will require strict attention in training so as to fill up any gaps ere the final touches are put on. Very strong shoots should be bent lower than weak ones, thus giving an even chance to all.

The excessively wet weather in the east has been very favorable for the development of the black rust, which is a Peronospora, or very closely allied to it. I have kept it in check by the use of sulphur vivum of black sulphur applied freely with the bellows. This fungus attacks the stems and the under sides of the leaves so that it is important to apply the remedy all over the plant.

If plants have their pots full of roots they should have some stimulants, not too strong. I use for a few days liquid cow manure, then sheep manure, and once or twice during the season I give sulphate of ammonia—half an ounce to three gallons of water; this must be used with caution or damage will be done.

Standards should now be carefully attended and carefully trained, as after this month the wood hardens and there is no further chance of filling gaps; leading shoots can be stopped once more if necessary to encourage a few side breaks to fill in with.

Plants for exhibition cut flowers will require daily attention, selecting such growths as are perfect, watching for insects as various caterpillars, grasshoppers and a peculiar beetle; this last fellow seems to stand on his head and eats out the very center of any shoot he fancies. I make it a point to let each plant carry an extra shoot or two in case of accidents, which so frequently happen.

It will soon be time to begin selecting flower buds, and as some prefer terminal buds of all varieties, and others crown buds, the selection is left for each to decide, but whichever is selected leave something to fall back on in case your first choice is crippled.

Those plants of late varieties for commercial cut flowers can yet be stopped

for the last time, except perhaps Grandiflorum, though last year I stopped this on the 24th of August and it was in full flower by the 1st of November; this was owing to the wood being well ripened at the time of the stopping.

It is not too late either to put in another batch of cuttings, either for stock or to grow in 4-inch pots.

Pearl River, N. Y. JOHN THORPE.

Cultural Notes.

Plants intended to produce large blooms, whether for home decoration or exhibition, are now growing freely, and where many plants are cultivated will almost require daily attention in the matter of securing the growths to prevent accident to the extreme points which at this time are very soft and succulent. All plants having made their first break will grow away freely, and each shoot retained should be securely fastened to upright stakes, which are fastened to the cross rails. When all the shoots are supported in this way each one obtains its equal share of light and sun much better than when three branches are tied to one center stake. By the former method mildew is not nearly so likely to attack the leaves, and ripening of the wood progresses with the growth of the plant by the assistance of a free leaf development. The ripening of the branches of chrysanthemums at this time of the year is not nearly so much thought about as it should be. The growth, as it is made, should be hardened. It is the treatment at this stage of the growth of the plants which goes a long way toward success on the one hand, and failure on the other. With the plants growing quickly, gross-growing sorts need constant attention to see that the bast with which the points of the shoots are fastened is not too tight. Side growths which push from the stems in any way should be promptly removed, thereby concentrating the whole energy of the plant into the selected growths. Suckers which spring up from the base of the plant should be removed as fast as they grow, retaining any from scarce or new varieties for the purpose of supplying cuttings next December. If dibbled into sandy soil, even now, and placed in a slight bottom heat, they will quickly strike root and make sturdy little plants which will produce cuttings of strong growth at the proper time. Care should be taken in the removal of suckers. See that the roots of the plants are not damaged unnecessarily by cutting out the suckers with a knife, as is sometimes done. The safest way to remove them is to break them off above the soil.

Mildew, I notice, has made its appearance on the leaves of some varieties. Meg Merrilies and its sport, Ralph Brocklebank, are more subject to this pest than are the bulk of varieties. Upon those kinds it is generally to be found after a spell of hot or cold wet weather, owing, possibly, to some defect in their constitution. A dusting over the affected parts with brown sulphur is the best remedy, especially if it be applied early—as soon as the mildew is seen.

The recent hot weather has been very trying to chrysanthemum cultivators where water is not plentiful, as the plants have needed a supply in some localities twice daily. Under no conditions must the roots be allowed to become dry. As a rule, the soil in the pots should be examined twice daily, and there is no more certain way of ascertaining their condition than by ringing the pots with the

CHRYSANTHEMUM ADA SPAULDING

knuckles. Any plants which are dry, or approaching that state, should have sufficient water given them to thoroughly soak every part of the soil, and then let it wait until it is again in the same state. Where it is possible to obtain it, the water should be soft. Where water is continually applied to the plant in a hard, cold state, the foliage assumes a pale green color, which is not pleasant to look upon. Especially do they assume this sickly tint if the soil in which they are growing is very much impregnated with chalk, as it will be if the turf was taken from a chalk district. An excess of lime is injurious to chrysanthemums, although a sufficiency is an advantage.

Bush plants will have received their last stopping of the shoots, and the branches will need some sort of support to prevent their being broken by winds or other causes. As a temporary protection in this respect, place three or four stakes around the outside of the pot, and to them fasten some bast, encircling the branches so that they are made secure, to be thoroughly staked out at a later stage. The same care in supplying these plants with water, warding off insects and other details of culture apply equally to this class of plants as it does to those grown solely to produce a limited number of blooms; indeed, more care really is necessary to maintain the foliage in good condition than in the case of the other method, as much of the beauty of bush grown plants is lost if the foliage is defective through the ravages of insects or mildew. Specimen plants should have their shoots trained as growth proceeds, as it is much easier done now than later when the wood is ripening. In hot, dry weather the plants will derive much benefit from being vigorously

syringed twice daily. The foliage is kept free from dust and insects find it more difficult to obtain a foothold than when the foliage is not disturbed in any way. In showery or cold weather the plants should not be syringed at all, and only once, this in the afternoon, if the nights be favored with heavy dews, otherwise a good syringing early in the morning after a warm, dry night will prove advantageous. Especially will this be noticeable if the position in which the plants are growing is high and at all exposed to the north or easterly winds, which are always more of a parching description than when they come from opposite quarters. For syringing the plants we use the garden engine, going between the rows and returning in the opposite direction. In this way we are enabled to apply the water to the foliage with some force.—E. M., in *London Garden*.

CHRYSANTHEMUM ADA SPAULDING.—This is a new kind raised by Thos. H. Spaulding, Orange, N. J. It is as I saw it last year, the most beautiful and perfectly incurved variety extant. The flower is very large, the base of a bright rosy lilac crowning to pure white. The habit is strong and very sturdy, indeed it is a model of strength and vigor.

JOHN THORPE.

The Functions of Leaves.

[Extracts from a paper read before the Manchester Horticultural Improvement Society, by W. Birkenhead.]

The part played by leaves in the economy of nature is of such vast importance that we cannot learn too much about their functions, and I therefore hope that my words may be sufficiently lucid to

waken a deep interest in the subject selected for our present consideration, viz: "The functions of leaves under the influence of Sunlight."

I at once launch the proposition that the leaves of plants in the aggregate constitute the work-shop or factory in which the sun does that great work of forming, out of crude material, all the floral beauty which delights the eye; all luscious juices which give pleasure to the palate; all the perfumes which make the air delightful to breathe; and all the nutrition which goes to support life, and supply the energy by which we act. Indeed I may go so far as to say that if through the absence of sunlight the functions of leaves were effectually and permanently stopped, human existence would soon be a thing of the past. I use the term "leaves" in a broad sense, as covering all those parts of plants in which the functions of true leaves are carried on, by whatever artificial names they may for convenience sake, be sub-divided; so that the fronds of ferns, as well as the scale-like prothallium of the young fern before it has produced a frond; the marchantia or liverwort, and also the fleshy stems of the cacti and the prickly pear, come under the broad designation of leaves, because of their dependence upon sunlight for the performance of their work. It may be objected that some plants will grow in the dark, such for instance as the mushroom and other fungi, rhubarb, seakale, and potatoes, for I have myself had new potatoes produced from a few tubers which had been left in a dark cellar beyond the usual time for planting, but then they were very small, and we must bear in mind that they had their origin in the nutrition previously stored up in the old tubers, through the action of sunlight on the leaves of the parent plant. So also with rhubarb when forced; all that we get in that case is the development of the stored up juices prepared in the leaves of the plant by the action of the sun upon them during the previous summer. In seakale the same thing takes place, while the mushroom is generated and grows upon the lifeless remains of vegetation which had been equally dependent for its existence upon the sun's light of earlier days; so that in the fungi we get the result of sunlight or vegetation second hand as it were. Having observed that the sun's action on the juices of plants takes place in their leaves, we must consider briefly the structure of a leaf in order to understand the mode of action and its importance. In the typical leaf we get a skeleton or framework of a firm, woody character, filled in the interstices with a vast number of cells containing the juices of the plant, and protected on all sides by a skin-like covering called the cuticle or epidermis. Now this cuticle is composed of flattened cells in close contact with each other; usually one layer, but sometimes two or even three layers, especially in plants growing in warm climates; and in the oleander four may sometimes be distinguished. Its office seems to be to prevent the moisture evaporating from the cells composing the soft succulent tissues of the leaf; since if they were to dry up, their vital properties would be lost. Accordingly we find a great degree of variation in the thickness and closeness of this epidermis or skin, for those plants which can endure intensely bright and hot sunshine are generally protected by a much thicker and closer cuticle than those suited to shady places, or which grow immersed in water. The tissues protected by the cuticle are not entirely cut off by it, however, from

the external air; for it has certain apertures of a very peculiar character, which open or close under the influence of light. These apertures are called stomata (mouths). They are usually of an oval form, and bounded by two kidney-shaped cells containing green matter; and it is by the expansion or contraction of these that the orifice is diminished or increased. Sometimes, however, the opening is round and is bounded by a ring of four or five such cells; and in the very curious stomata of the *Marchantia polymorpha*, one of the commonest of the liverwort tribe, there are five such rings, one beneath the other, the aperture resembling a funnel, and the lowest ring being the one which regulates the amount of communication between the chamber into which it opens and the external air. Stomata are always placed over interspaces in the tissue, which are called intercellular passages; they are never found on the mid-rib or veins of a leaf, nor in fact over any hard woody portion of the structure. They are chiefly disposed over the soft green tissue of leaves and young shoots, but they are found also on parts of the flower. When the true leaves are absent and the stem performs their functions (as in the cactus or prickly pear tribe) stomata are found on its surface. They are generally most abundant on the under surface of leaves and are sometimes altogether absent from the upper. This is partly due to the fact that the tissue lying beneath the upper surface of leaves is so closely packed together, that there are scarcely any intercellular passages into which the stomata might open; whilst the tissue in contact with the lower cuticle is extremely loose in comparison and abounds with such passages; hence it is that the color of the upper surface of the leaf is usually so much deeper than of the lower. But in leaves in which the two sides are equally exposed to the air and light, such as those of the iris and of the flag growing by the sides of brooks, the general structure is nearly the same on the two sides, and the stomata are equal in number. Again, in plants whose leaves are exposed to the atmosphere on their upper sides only, as in the water lily, in which the leaves float on the surface of the water, the stomata are disposed on that side alone. As there are no dense cells to protect the tissues of plants growing altogether beneath the surface of the water, so there is no occasion for stomata to admit the passage of air to these; and accordingly in the whole tribe of sea weeds we find no vestige of them. They can not be distinctly traced in the mushroom tribe, nor in lichens, but in the liverworts they present themselves, while in most ferns as well as in flowering plants they abound. Of the very minute size of these curious organs some idea may be formed from the fact that in some leaves it is estimated that 70,000 occur in a square inch of the cuticle. Their function is evidently to allow the evaporation of water from the soft tissues of the plant, which is one of the most important processes by which the crude fluid, absorbed by the roots, is converted into the nutritious sap or proper juice. The influence of light upon the stomata causes them to open, while they contract, or even close in darkness. Now it must be remembered that plants can only take their food in a soluble condition, so that the carbon, sulphur, phosphorus, chlorine, iodine, bromine, silicon, potassium, sodium, calcium, magnesium, aluminium, iron and manganese (which are taken into the structure of different

plants) must all be made soluble before they can enter the exceedingly minute feeders belonging to the roots. Hence an immense quantity of water charged with these elements is taken up by the roots of plants and conveyed to their leaves, there to undergo those wonderful changes caused by the operation of the sun's light, which fit them to be built up into the structure of the plant, its flowers and its fruit. In the process of these changes a large quantity of surplus water has to be got rid of, and hence we may see the importance of the stomata, as mouths or doors opening into air passages in the leaf, through which this surplus fluid is exhaled. It may be well here to observe that the rapidity of absorption is in part governed by the rapidity of exhalation. The latter is nearly checked by the absence of light, and so plants are found to absorb but little in the night, or in a dark room. Now the

IRON PLANT STAND.

fluid which is so abundantly taken up by the roots of plants and which is conveyed upward along the interior of the stem is very unfit for the nourishment of the structure and for the supply of the growing parts, until it has been exposed to the influence of the light and air, by which great changes are effected in its properties, and power is given to it for the maintaining of life. This can not be effected either by the underground roots or by the hard woody stems and branches, but is accomplished in the leaves, where there is an enormous breadth of soft tissue exposed to the light as well as to the air. The action of sunlight on the surface of the leaf causes the myriads of stomata or mouths in the cuticle of the leaf to open, so that the air can enter the internal chambers where it gives vitality to the sap, just as it gives vitality to the blood of an animal when received into the lungs. At the same time the opening of the stomata affords an opportunity for the escape of an immense quantity of watery vapor and gases which are exhaled or driven out of the leaf by the forces acting upon them in the leaf. There the sun's light causes marvelous chemical changes in the crude elements carried by the sap from the roots, to be elaborated or digested; and it becomes at once apparent that if these forces are stopped for any lengthened period while they should be active the results must be disastrous. Hence if we find that in the absence of sunlight these activities cease and the crude sap remains unfitted to nourish the plant, through not being digested, we may look for a weak and sickly patient in the plant so deprived of light. And so also may we look for weakness in the tree which is deprived of its leaves by over-much pruning; or in the fern which has been denuded of its foliage till it has become a stunted wreck

of its former self. Now, a few simple experiments will show that there is a strong probability that this rapid transpiration takes place through the stomata. If a piece of glass be held near the upper surface of the leaf of a vine actively growing in a hothouse little effect will be produced upon it, but if it be held near the under surface the glass will soon be dimmed by the vapor, and in a short time longer this will accumulate so as to form drops. As the upper surface of a vine leaf is nearly destitute of stomata, while the lower is thickly covered with them, the disproportion in these effects is at once explained if the transpiration really takes place through these apertures. Similar experiments on other plants lead to the same general result. Where the stomata are equal in number on the two surfaces both seem to transpire alike, and when neither possess stomata capable of action the transpiration is scarcely to be observed. Again, if a plant, actively transpiring under the influence of sunlight, be carried into a dark room its transpiration is immediately and almost entirely checked; and if its stomata be then examined they will be found to have closed. Thus it appears almost unquestionable that the rapid loss of fluid from the whole vegetable surface, but especially from the leaves which constitute a most important part of the economy of the living plant, is regulated by the number of stomata which each part contains, and by the degree in which light acts upon them. The exhalation of fluid from the living plant then may be regarded in part as a kind of evaporation from its interior, and will be promoted by the warmth and dryness of the air around, but it is entirely controlled by the stomata, which by admitting or excluding the air, permit or check it in accordance with the influence of light upon them. Thus, then, we see one important mode in which light influences the growing plant. No amount of heat can supply a deficiency of this agent, for if it be excluded, exhalation is entirely prevented, and all the fluid that is transpired has to pass off by the slow process of evaporation from the external surface only, which is not nearly sufficient for the concentration of the sap. Moreover, when the exhalation is checked absorption soon ceases; for the tissues become gorged with fluid and are capable of containing no more. If a plant accustomed to grow in open day be kept for some time in the dark it becomes unhealthy, and as it were dropsical, and will generally die if not restored to its usual condition. It has been ascertained that the young leaves and shoots of the wild corn exhalate twice their own weight of water daily. A common sized cabbage in the twelve hours of daylight was ascertained by Hales (one of the best experimenters upon this interesting subject) to exhale from 15 to 25 ounces daily, according to the light and warmth to which it was exposed. The concentration of the crude sap by the loss of its superfluous fluid and the occasional absorption of what may be necessary to supply the amount insufficiently afforded by the roots, are by no means the only functions of leaves. The most important function that plants perform results from their taking up carbonic acid from the air and soil. When plants are exposed to the action of sunlight a series of chemical changes are brought into play, which are essential to the life of the plant. The carbonic acid of the air will be decomposed by the green parts of the surface of the plants, and the solid carbon

REX BEGONIAS AT SOUTH PARK, CHICAGO

will be fixed within its tissues, while the oxygen will be set free so as to restore the purity of the air. It is in the performance of this function that the leaves, from the extent of green surface they present, are peculiarly energetic. The proportion of carbonic acid in which the healthy plant will thrive under the influence of strong sunlight is not less than 7 or 8 per cent; but a much smaller proportion than this will soon be fatal to it if grown in the shade. It is to a peculiar compound formed in the cells of the green surfaces, of which the carbon introduced from the air is an essential ingredient, that the color is due; and as this fixation can only take place under the influence of sunlight (artificial light, even the most powerful, having no influence upon it), plants which grow in dark situations are either in part or entirely destitute of color. The influence of light upon the green color of the leaves is remarkably shown when the buds are unfolding. The stronger the sunshine the sooner will they assume their characteristic hue, and on the other hand, in dark, dull weather they will remain for days together, almost of the same color as before they expanded. Permit me now to express a hope that the study of this subject may be a help to us in our horticultural practice, whether it be in the arrangement of plants, the pruning of trees or the treatment of bulbs after their flowers are gone.

Rex Begonias.

Our illustration shows a nook in the conservatory at South Park, Chicago, where Superintendent Kanst has massed a lot of his immense specimen Rex begonias. Many of these plants are three feet through and indicate what may be done with the Rex begonia by skillful handling.

Those in the foreground stand on brick piers, the bottom of the pot being within about half an inch of the surface of the water. They thrive splendidly in this position. The moisture is supplied to the plant by absorption in just the quantities required and to the under surface of the leaves which is necessary to the best development of the plant.

They can be grown nearly as well in the dwelling by placing the pot on a brick in a pan of water, keeping the water about half an inch below the upper surface of the brick, which being porous draws the water up to the plant as required. Florists should advise buyers of Rex begonias to try this method.

Iron Plant Stand.

Mr. Wm. K. Harris, Philadelphia, is a man of ideas; one of them is shown in the accompanying sketch. The stand seen at the right is made of iron pipe (1½ to 1½ inch) with iron flanges screwed on each end. He has them in several sizes, from 15 to 20 inches in height and from 6-inch flange at top and 7-inch flange at

bottom to 7-inch flange at top and 9-inch flange at bottom.

They are of considerable value in economizing room in houses occupied by palms, ferns and other plants which like partial shade. The method of using is shown in the sketch at the left, and it can be readily seen how much space is saved. Of course these should be used only among plants which like partial shade. All parts of the stand should be of galvanized iron, as otherwise rust may do some injury. At first glance it will be thought that the stands must surely tip over when the plants are being watered, but Mr. Harris finds no trouble from this source. The stands cost to make from 50c. to 75c. each, but will undoubtedly last a life time.

A feature which while probably of no great practical value is still worthy of consideration, is that in a house in which these stands are used the plants show off to much better advantage than when all are placed on a common level.

MANATEE, FLA.—E. N. Reasoner, accompanied by R. D. Hoyt, of Bay View, Fla., returned July 23 from a three week's yachting cruise among the South Florida keys, from Key West to Biscayne Bay. They managed to get in some work on botanizing, and succeeded in establishing the identity of a new palm to the U. S. It is *Thrinax excelsa*, and had been confounded with *Thrinax argentea*, the "silver thatch." It is a magnificent palm adapted for greenhouse use.

A Device for Decorators

For the last three months we have in decorating used a device of our own get up which has been of such assistance that we thought it might be of value to others.

It is a simple contrivance for decorating bay windows, corners of parlors, etc., for weddings and receptions.

About eight times out of ten the bay window is selected to be handsomely decorated "with all, or mostly all, plants, ferns especially, and have a couple of tall palms to reach out over head, make a regular fern grotto of the window, but don't have the plants built out too far, so we can get at the window, etc." After receiving such an order the florist goes away wondering how he is going to accomplish it all. In the first place he has no palms over three or four feet high and if he can not bring the pots out a distance on the floor how can he build them up high and feel sure they will not tumble?

I will try and explain one way. Measure the height of the wall. If it is eleven feet have your wire-worker make two strong V shaped troughs (as shown in upper sketch) seven or eight inches deep and the same in width, with strong round iron running the entire length which should be about nine and one-half feet. Line these with strong manilla paper and fill loosely with sphagnum moss. Select one end for the top and removing a sea-forthia or kentia palm, three or four feet high, from its pot place it in the upper end of the trough, pack it well with moss and wire it in position. Have the plant lean over enough to be graceful. Then place another a foot or so shorter, below it and so on until you get half way down where room is valuable then use shorter latania palms. Fill the one for the opposite side in much the same way.

For the inside window have two or more of the same arrangements. They can all be arranged at home and set up in ten minutes in the room to be decorated. They are held in position by fastening the top end to the picture moulding. After they are in place you may see fit to readjust the palms by tying the stems in position, then with a lot of common ferns which have been stemmed you can fill in any places where the moss shows or more foliage is needed. Finish by placing a few good plants of alsophilas, cyperus or similar plants at the base. Of course the arrangement should be natural and as free from stiffness as possible. The wire troughs are of course available for use any number of times. The accompanying sketch may serve to give an idea as to their application.

Milwaukee.

C. B. WHITNALL

Leaves of Advice From a Limb of the Law.

(For Young Florists.)

VIII.

Must have been out rather late last night, for I observe that you turn that sprinkler on your own head every now and then. I would have a hot head, would I, if a man had ordered 1000 hyacinths of me, and after I had bought them for him at a very reasonable figure and was just calculating my prospective profits he should send me word that he had changed his mind and didn't want them.

Why, no, to the contrary, my head would be very cool at such a juncture; that is provided he was a responsible man.

Yes, I do mean to say that in such a case the law doesn't permit a man to change his mind. When he gave you that order and you accepted it your

minds met, as we say, and the resulting contract became absolute.

Of course had he returned and given you due notice not to fill the order before you had time to do anything more than note the order on your books, then you would proceed at your peril. For in that case you could prove no damages. Or at most a mere trifle, and the law takes no notice of trifles. But in this case he did not countermand the order until you had purchased the goods and they had been shipped to you.

Now two courses are open for you. Either you may ship the plants to him, taking good care that they are offered to him in perfect condition and according to sample or quality ordered and give

A DEVICE FOR DECORATORS

yourself no further anxiety as to what becomes of them—whether he accepts them or allows them to lie on the sidewalk and rot. Or, you may sell the plants for his account, first giving him notice and sue him for any deficit that may arise.

Yes, he may come into court and say that his order was only a conditional one. In that case if he could prove it you would be obliged to take the hyacinths and get rid of them to the best advantage possible.

The very essence of a contract is that it should be a full and perfect agreement between two or more people. Hence if there are no witnesses and nothing in writing it becomes a question of veracity between the parties. Therefore always see to it that you either get a contract in writing or else have witnesses to the conversation.

Now, there is another element in such a contract as this one, and that is—time. This customer may take the position that he gave the order, but that it was specifically agreed that you were to deliver the hyacinths within thirty days and that you failed to do so.

Contracts vary in many ways. A customer may come to you and say: "I will give you so much a dozen for 12 dozen tuberose bulbs." You decline. He says: "Think it over," and goes away. Now the law will not permit you to take a whole year or even a whole month to "think it over." You must make up your mind within a reasonable

time—say a week or ten days and must then give him notice of your acceptance.

No, he can not then say that he has changed his mind, for although he had a right to change his mind in such a one-sided transaction, so to speak, yet he is required to give you due notice of having changed his mind or he will be held to his offer.

I am coming to that. It often happens as you say, that a customer orders by letter. Here you are required to accept or decline promptly or else there would be no contract; but in no case proceed to execute the commission until you have accepted the offer, for you must not forget that one man can't make a contract. In the language of the old proverb: "It takes two to make a bargain."

When you have once reduced a contract to writing don't ask the other party to make any alteration by word of mouth. Have all alterations likewise in writing, and if the original document has a witness to the signatures take care that the second contract has the same.

Remember too, that when a contract is carried into court the law admits no evidence to contradict its terms or vary them in any way except it is a later contract.

This however does not apply to the explanation of a contract. For instance, a statement of goods sold may read: 12 d. plain flowers and 12 d. glazed do. Evidence would be admissible to prove that this meant: "Twelve dozen plain flower pots and twelve dozen glazed flower pots."

As a general rule too, a court will inquire into the consideration of a contract, and while a paper may state that the consideration was five hundred dollars, you would be permitted to show that in reality only one hundred cash and four hundred in merchandise was the consideration.

So too, a receipt may always be inquired into.

It does not follow that because you hold John Doe's receipt in full of all demands to date that you owe him no money. That receipt may have been left at your place of business by a stupid boy who was told to get the money or tear the name off.

In many ways contracts are rendered null and void. For instance, the law permits no minor to bind himself by contract. You have been letting young Jones have flowers for his sweetheart have you? Well, take care, while it may be true that old Jones is as rich as pitch, yet he might refuse to pay these bills.

No, that does not help the matter. It is not worth the paper it is written on. The law requires that a minor—to make his contracts good—should bind himself to pay them after he has become of age. To do this before doesn't help matters one bit.

Or again, contracts are rendered of no binding effect when a man is forced or defrauded into making the contract; or when the contract is against good morals. So too, the contracts of a lunatic are of no force, or of an ignorant person if it could be shown that he hadn't intelligence enough to grasp the matter.

Generally speaking, the husband is liable for goods and merchandise furnished his wife for her support and comfort. I don't think the law would regard the particular merchandise in which you deal as such a "necessary" which the husband would be obliged to pay for. So be discreet.

But having paid one bill for flowers, you would be justified in assuming that he consented to such purchases by his wife. However, in all these things, you

GROUP OF CATTLEYS.

must exercise good judgment. A man's success in business depends largely upon his lack or abundance of that commodity called "common sense."

Don't say to any customer: "We want your trade whether you pay or not." Above all, don't try to make business by delivering more than called for by the contract, or by delivering merchandise not up to the requirements of the contract. These are two bad business principles. Some men might not mind a variation of a few dollars; others might withdraw their custom at once. Deal fairly, it will pay in the long run.

Your head is cooler is it? Glad to hear it. Too much blood in one's head means too little in one's heart, and bear in mind that a man needs something besides brains in this world.

UNCLE BLACKSTONE.

Cattleyas.

These will always be the popular orchid flowers for cutting purposes, owing to their large size, bright colors and lasting qualities. Fortunately those suitable for this purpose are among the easiest grown, can be procured in almost any quantity and at very reasonable rates. All the species excepting *citrina* are natives of Central and South America, and are found growing under various conditions

of climate, from the hot swampy lowlands of Brazil where *superba* and *Eldorado* are found, the breezy seacoasts of Venezuela, the home of *Mossiea*, to the cooler mountainous home of *Trianae* in Columbia.

No arbitrary rules therefore can be given for the culture of the genus, or even of a species, for often these may be seen flourishing under totally different conditions. In growing these plants one must always bear in mind that they usually grow on trees, therefore the roots should not be over loaded with soil; that they are screened from the fierce rays of the sun, but sufficient reaches them to thoroughly ripen the bulb, otherwise they do not flower satisfactorily. The temperature is usually very high in the day time, but the nights are cool with consequent great evaporation and tremendous rains fall during the growing season. To imitate these conditions as near as possible is the aim of the cultivator, remembering that abundance of heat and water is necessary to make good bulbs, and light and air is necessary to flower them.

The following kinds are among the most useful and a small quantity of each will insure cattleyas every month in the year: *Mendelli* and *Mossiea* should be in bloom in June, to be followed by *Gigas* with its many varieties, *Sanderiana*, *Imperialis*, etc., and *Gaskelliana*, both

good species for summer work; in late summer *speciosissima* and *maxima* will be in bloom, followed by *Bowringiana* (and especially good species of the *Skinnerii* type) and *Percivaliana*; *Laurenceana* is rather too expensive just yet. The early varieties of *Trianae* will now be in and this species should keep up the supply till *Skinnerii* and the early *Warneris* are due.

F. GOLDRING.

Kenwood, N. Y.

TORONTO, ONT.—The annual flower show held under the auspices of the Toronto Electoral District Society was a grand success. The interest in the display appears to be growing each year. The premium list was very lengthy and covered nearly everything that is in condition to exhibit at this season. Of the first premiums awarded for plants Geo. Reeves received 7, Sir David Macpherson 8, Cotterill Bros. 4, John Chambers, park superintendent, 8, H. A. Massey 3, Horticultural Gardens 4, Robert Murray 8, Jos. Graham 1, D. Falconer 1, Col. Gzowski 1, and Thos. Carter 1. Of the first premiums awarded for cut flowers Jos. Graham received 4, T. Clinkenboomer 9, H. A. Massey 2, Granger Bros. 1, S. Tidy & Son 2, Mantou Bros. 3, Sir David Macpherson 1, A. Terryberry 3, Alex. Reid 3, Noah Suley, Guelph 2, Geo. Anderson 1 and A. Gilchrist 1.

Ventilator Shaft.

The arrangement of the ventilator shafts at the greenhouses of Mr. C. S. Price, Lansdowne, Pa., is unique but certainly excellent. One objectionable feature of ventilating machinery is the weight and strain on the roof from the

VENTILATOR SHAFT.

shafting and machinery; this Mr. Price has very successfully overcome. As will be seen in the accompanying sketch each of the iron pipe columns which support the ridge is provided with a four way tee, at a distance of about a foot from the ridge. This tee is $1\frac{1}{4}$ inch one way to connect with the $1\frac{1}{4}$ inch column, and 1 inch the other way, the shafting being of 1 inch pipe—the threads are reamed out the 1-inch way, thus giving the 1-inch shafting room to revolve easily.

This makes a neat light job, much preferable to the usual way, and brings the strain on the iron standards instead of the rafters. The machinery as arranged by Mr. Price works with the greatest ease.

Boston Notes.

Thos. Waterworth, of Braintree, reports a loss of 1,600 lights of glass by hail on July 17. No insurance.

N. F. McCarthy is receiving congratulations. But it is a girl.

At a recent exhibition of the Mass. Hort. Society Pitcher & Manilla showed a new achillea, which has been named "The Pearl." It is more upright in growth and the flowers are whiter than the old variety.

John Reardon, an old and well known gardener, died August 1. He has had charge of the State House grounds, the Granary Burying Ground and other city cemeteries for many years.

The Garden Committee of the Mass. Hort. Society and friends have been enjoying visits to several prominent establishments recently. On Wednesday July 31, they were hospitably entertained by Mr. B. G. Smith, an amateur at Cambridge, and on August 7 they visited Newton Cemetery and the extensive nursery of W. C. Strong, at Newton. Mr. Strong showed a number of thrifty looking spruces in support of his theory that August is the best time to transplant evergreens, but the majority of the committee declined to be convinced.

The annual excursion of the Gardeners' and Florists' Club took place on Tuesday July 30, at Downer Landing, a favorite picnic resort in Boston Harbor. It was one of the most enjoyable occasions they have ever attended and was a great success in every detail.

A game of base ball between nines representing the florists and the gardeners was won by the latter. Much amusement was caused by a "potato race," participated in by nine nimble runners, and some of the high jumping shown would have done credit to profes-

sionals. Lively music was furnished by a lusty member with the bagpipes. The dance hall was a magnet for the younger members, while the more sedate found amusement and muscular exercise in the bowling alley. The party was photographed before leaving the grounds. Two former Bostonians, W. A. Manda and J. A. Penman, came all the way from New York to participate in the day's sport. M. F. Gallagher, of Chicago, who was in town a few days previous was also expected to be present, but was unfortunately called away by a telegram announcing the illness of a friend in New York. W. J. S.

BUFFALO, N. Y.—C. F. Christensen is preparing to add a new house 100x20. Wm Scott has built another carnation house 170x19. W. J. Palmer has completed two houses, one 235 x 21 for roses and another 150 x 25 for carnations.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED—By a single man, as head S gardener or foreman in private place; first class planter. Address X Y, care American Florist.

SITUATION WANTED—As foreman or propagator to the beginning of October; age 27; wages expected, \$30. Address Box 10, care American Florist.

SITUATION WANTED—Seed trade, 12 years' experience in leading European and American houses; age 27; first class references. Address D. CAWICHA, 311 W 2nd St. Ext. Baltimore, Md.

SITUATION WANTED—Have had six years' experience in greenhouse, lawn and garden, under market plants, cut flowers and flower beds. Good reference. Address H M, Am. Florist.

SITUATION WANTED—Private or commercial, S English, single, 30 years' experience in all branches; first class reference. Address J. W. S. care Craig & Bro., 49th & Market, Philadelphia, Pa.

SITUATION WANTED—As foreman, commercial, S German, single, 17 years' experience; 11 years in this country; first class references. Florist, cure Robt. Craig, 49th and Market, Philadelphia, Pa.

SITUATION WANTED—On private or commercial place, by experienced grower of all sorts and greenhouse plants, roses, orchids, ferns, etc.; also fruit of all descriptions under glass; 10 years with practical experience. References given. Address H. STOCKING, 11 Temple St., Newburyport, Mass.

SITUATION WANTED—By a single young man, S as florist, understands rose growing, both in doors and out, also grafting; also has experience of private gardening and nursery work; over 10 years' experience in gardening in all branches; best reference. Address H B S, 25 Silver St., Kensington, Philadelphia, Pa.

WANTED—At once, a competent rose propagator to take charge of our house. Married man preferred, must be sober. Address ROOP & ZIE, Westminster, Md.

WANTED—By thoroughly practical florist, position as superintendent private or commercial place; good salary required; first rate references. Address with particulars ALPHA, care American Florist.

WANTED—Single man, as gardener and coachman, who understands care of small greenhouse and is willing to make himself generally useful. Address C. L. CROSS, Riverside, Ill.

WANTED—Single man to run my greenhouses on shares, or will lease same. Two 75 ft. houses nearly new—head house with sleeping room. Steam heat. Best of references given and required. Address A. E. HOTT, Atkinson Depot, N. H.

WANTED—Sept. 1st, a competent man to take charge of greenhouses. One who understands the propagation and forcing of roses especially desired. Must also have some taste for cut flower work. The application of only first class men with ability and experience in commercial places and best of references will be entertained. Address Lock Box 1018, HENRY A. DREER, Philadelphia.

WANTED—Experienced commercial florist as assistant foreman at Dreyer's Nursery, Riverton. The application of only first class men with ability and experience in commercial places and best of references will be entertained. Address Lock Box 1018, HENRY A. DREER, Philadelphia.

WANTED—A first class gardener and florist to run a garden and greenhouse; must have \$300 or \$400 in cash. A good chance for a first class man. Must be able to make a good thing, a 2 story house, good barn, wind pump, tanks, hydrant, greenhouse, etc., and manure for one year on the ground. None but a man who can meet the requirements and come well recommended need apply. Address S. K. HAGINS, Portland, Ind.

WANTED—On a commercial place, a gardener—single German preferred—thoroughly experienced and successful in growing roses, cut flowers in variety, and bedding plants. To the right man a permanent situation. Address with references J. NEWMAN & SONS, 51 Tremont St., Boston, Mass.

FOR SALE—Greenhouse property; the location: A good stock of plants. Only greenhouse in city of 10,000 inhabitants. MARY A. WAKE, Newton, Kan.

FOR SALE AND LEASE—My greenhouse and nursery business. Rare chance for good rose grower with some means. Full. PREIFER, Sedalia, Mo.

FOR SALE—Splendid opening for enterprising florist. 1/4, 1/2 greenhouses, 1/2 acres, long lease, small rent, best location; only \$800 or \$500 required. Address A. A. MILLER, Washington, D. C.

FOR SALE—In a booming city, a business controlling the trade of 5,000 inhabitants. No discount on it in any way. 11 health only reason for selling. Price \$1250. Address MRS. A. J. BAIN, 317 West 9th St., Pueblo, Colorado.

FOR SALE OR RENT—Greenhouse property, only one in the growing city of Ashbury Park; established 10 years; good location, aristocratic water and doing a good business. Address J. H. B. P. O. box 25, Ashbury Park, N. J.

FOR SALE—No. 6 Hydraulic Ram, cost \$40. Price \$20. Sold because town water passes my place, and not needed. A fine thing to let water from a stream. In perfect order. Address ALEXANDER MEAD, Greenwich, Conn.

FOR SALE—Good established florist business with 5 greenhouses, a 5-room dwelling, 1/2 acre of land, and large choice collection of plants, cut flowers from postoffice, in County Seat of 8,000 inhabitants. Address S H B, care American Florist.

FOR SALE—Our entire hot water heating apparatus, consisting of 6 radiators, 1 boiler, 1/2 inch pipe and fittings. Offer solicited, or price sent on application to J. NEWMAN & SONS, Boston, Mass.

FOR SALE—A rare chance for gardeners and florists. A well established and remunerative business, consisting of a large lot of land, with a good dwelling, barn, 2 greenhouses with hot water furnace, a good well and hydrant water supply, 5 acres well cultivated, capable of growing within a mile from above mentioned premises, a large lot of choice plants, bulbs, trees, etc., 1 horse, wagons, cutter, sleigh, and various other useful implements for sale at a bargain. Apply early to MRS. MAGDALENE DINGER, Eau Claire, Wis.

TO LEASE—For 5 years. Florist business, established 15 years; 5 greenhouses, heated by hot water; water supply from windmill. Situated 14 miles north of Toronto, Canada. First class stock. Address COLIN SKINNER, 275 Yonge St., Toronto, Canada, or during Convention, Mr. KILLEN, care J. C. Vaughan.

FOR SALE.

Snowflake Daisies for fall and winter cut flowers. Also large bulbs of the fragrant, double and single Narcissus. Will exchange for lily bulbs, or florists' requisites. Address A. W. MORGAN, 103 W. Kimber St., Danville, Ill.

FOR SALE.

Greenhouses with ground and complete stock, consisting of roses, chrysanthemums, carnations and general bedding plants, etc. Houses heated with hot water and built from most modern plans; situated in 130 acre tract, 500 paces from Philadelphia and Camden, near railroad station. Excellent opportunity, best reasons for selling. Cheap, \$1,500 on easy terms. Address with particulars FLORIST, Box 15, Haddonfield, N. J.

FOR SALE.

TWO SPECIMEN WHITE AZALEAS, standing 6 ft. high, 7 ft. through, 2 ft. in circumference, and very shapely in form. In perfect health and condition; is fully set with bud for a magnificent bloom. Sold separately if desired. Address GEO. F. CUTLER, Taunton, Mass.

FOR SALE.

One Hot Water Boiler capable of heating 100 feet 1-inch pipe, in first class order, nearly new.

Also a fine stock of plants, such as Begonias in the var., 3-inch pots, Coleus in var., 2-inch pots, Geraniums in the var., 2, 3 and 4-inch pots. Double Saxifrage, 2-inch pots, Pelargoniums in var., 3-inch pots, Callas, and 6-in. pots. Bulbs of all kinds. Apply for prices before buying elsewhere.

The BOILER will be sold at a bargain.

JOS. SHAW, Austin, Ill.

WANTED TO PURCHASE.

Greenhouses with an established trade not less than 500 feet of glass with stock must be in good location, near by either New York, Boston, Philadelphia or Chicago. Address with particulars, price, etc. H. E. care American Florist, Chicago, Ill.

ROSES AND SMILAX.

La France and Contiers, 3-in. pots, 4 cts. Niphets and Mermets, 3-in. pots, 5 cts. Heavy Smilax, 2 1/2-inch pots, 2 cts.

JORDAN FLORAL CO.,
706 Olive Street, ST. LOUIS, MO.

WOOTTONS.

WE HAVE STILL A FEW LEFT AFTER PLANTING 20,000 FOR NEXT WINTER'S CUT.

These 20,000 plants required 1,800 running feet of Greenhouses 16 feet wide, which we have erected at a cost of \$35,000, to be devoted exclusively to "WOOTTONS."

Why we plant this Enormous Number, and Why you should do likewise.

Because it is the best red rose in the world.
Because it blooms continuously for the whole year.
Because it is as large as an American Beauty, and
Because it is of a much richer color.
Because it blooms best in winter.
Because with us it never has shown disease.
Because reports from hundreds of growers are favorable.
Because next winter it will pay four times the profit of any other rose.
Because the greatest profit will be this coming season.

Because its fragrance equals "Jack."
Because it is no snare and delusion like hundreds of others that you and I have tried.
Because it has been thoroughly tested.
Because we offer it at reasonable figures.
Because red roses will take the lead this winter.
Because it is a home production.
Because it has taken first prizes whenever exhibited.
Because ALL THE FLOWERS ARE PERFECT, WITH LONG STEMS AND ELEGANT FOLIAGE.

REMEMBER THE \$300 PRIZE WHICH WE OFFER.

Plants in perfect order, from 3-inch pots, at \$180 per thousand; \$100 per five hundred; \$25 per hundred; less quantity, 50 cents each, fifty plants at hundred rate, during August and September.

THE AMERICAN FLORIST CO., Chicago.

CATALOGUE DESCRIPTIONS.

What brilliant word painters some of the catalogue compilers are! But, alas, they so frequently look at the same flower through glasses of different color. In one catalogue geranium C. A. Knorr is described as "Brilliant lilac-red, with maculated red spots on upper petals;" in another as "Deep purplish red shading to crimson," and in still another as "Crisp shaded lilac, upper petals fiery red." No wonder substitution is easy. And what need have we of a number of varieties when different men can make such different flowers bloom on plants presumably grown from the same original stock! Again we find geranium Remarkable described in one catalogue as "Very deep rich crimson" and in another as "Very rich deep magenta." It is especially gratifying to note that in one case it is "Very deep rich" and in the other "Very rich deep," because they have practically agreed upon that point, in fact upon everything except the color.

Other descriptions given to the same variety by different catalogues are: "Pink with white center" and "Fiery rose, blending white eye;" "Intense dazzling scarlet" and "Yellowish or orange red;" "Fiery red" and "Brightscarlet;" "Deepest salmon" and "Deep orange overlaid with buff;" "Rich vivid crimson, shaded with carmine" and "Double violet, scarlet flowers;" "Delicate rose pearl color" and "Deep lilac and tender rose;" "Rose color" and "Pink;" "Rich deep maroon crimson" and "Velvet shaded purple" (what sort of a color is velvet?); "Crisp pink" and "Bright clear pink;" etc.

But here is the gem: "Garnet red tinted with rose brick color. Color new." Well, we should hope it was new. We trust that "Black amaranth marmorated chestnut brown" is also new and will never grow old. We have always felt weak on the color question, but we no longer feel lonesome.

Wouldn't it be a good idea to have some one give us a little instruction on this matter at Buffalo? A few object lessons might do some good, and we certainly need it.

THE GARDEN'S STORY, By George H. Ellwanger, is a charmingly written book which will be greatly enjoyed by every one who loves plants. And owing to the very attractive way in which the subject is presented it will undoubtedly be widely read and reveal the changing beauties of the hardy flower garden to many who would never dream of looking into the average book on gardening. We believe that this little book is destined to do great good in this way. It relates the various aspects of the author's garden near Rochester, N. Y., from early spring

until late autumn of the year 1888, treating the subject in such a delightful way as to keep the interest of the reader to the very end, while giving an immense amount of practical information. There is a copious index which enhances its value for reference. Published by D. Appleton & Co., New York; A. C. McClurg & Co., Chicago.

THE PENNSYLVANIA HORTICULTURAL SOCIETY has issued the premium list for the chrysanthemum show to be held November 11-16 next, and an advance sheet of premiums for the "Spring and Bulb Show" in April, 1890. The chrysanthemum premiums are very liberal, that for 12 plants 12 varieties being: First, \$100; second, \$85; third, \$65; fourth, \$50. For collection of orchids at the spring exhibition, \$75; \$50 and \$30 are offered and there is a lengthy list providing for nearly all flowering plants that are in season. For 12 buds of the Wootton rose there are special premiums of \$150, \$100 and \$50. Copies of the premium list may be obtained from D. D. L. Farson, secretary, Horticultural Hall, Philadelphia.

SOCIETY DUES.—If you can not possibly attend the Buffalo convention don't fail to at least remit the annual dues of \$3 to the secretary or treasurer, or send the amount by some friend who will attend, so that your membership in the society will be maintained. The annual report is alone worth many times the amount, and you should not fail to do your share toward the maintenance of the national society in the good work it is engaged in. If the dues of all members are promptly paid this year the society can go forward with some very important work, which it has been prevented from pushing through lack of funds.

THERE ARE some public spirited citizens in Cincinnati as is evidenced by the liberal special premiums offered at the first chrysanthemum show of the Cincinnati Florists' Society, which will be held November 12 to 16. The premium list in full appears in the supplement.

THE NEW YORK Times describes the foreman for a well known grower as "A quiet, diffident man, who, from long association with plants is seedy in appearance and slow at taking root, but when once started blooms quickly and is flowery of speech."

Coming Exhibitions.

August 20-22, Buffalo.—Exhibition at convention of Society of American Florists.

September 17-20, Boston.—Annual Exhibition Mass. Hort. Society.

November 5-8, Chicago.—Chrysanthemum Show Chicago Florist Club.

November 5-9, Indianapolis.—Chrysanthemum Show Society of Indiana Florists.

November 12-16, Philadelphia.—Chrysanthemum Show Pennsylvania Hort. Society.

November 12-14, Boston.—Chrysanthemum Show Mass. Hort. Society.

November 12-14, Orange, N. J.—Chrysanthemum Show New Jersey Floricultural Society.

November 12-16, Cincinnati.—Chrysanthemum Show Cincinnati Florist Club.

November 13-14, Worcester, Mass.—Chrysanthemum Show Worcester County Hort. Society.

Flower Beds in Chicago Parks.

To the editor of *Garden and Forest*:

SIR.—Allow me to express my satisfaction at Herr Jaeger's denouncement of the "lunacy" of the flower bed decorations of the South Park of Chicago.

I speak feelingly on the subject, not only because I have been held responsible for them, but what is still more aggravating, because I have been complimented upon them—and that by educated people—often than for any portion of what really constituted my design for the park. Only last summer a gentleman from New England, and a graduate of Harvard, to whom I chanced to be introduced, asked if the South Park was not my work, and immediately launched into an enthusiastic description of a life-size floral representation of three men rowing a boat.

My hope has been that men of sufficiently cultivated taste to appreciate justly the floral eccentricities that have distinguished that city for years (camels, elephants, base ball players, etc.), would equally appreciate the anomalous position of a landscape gardener in the mind of the average Park Commissioner, and not hold him responsible for outrages he is powerless to prevent. But the number who have spoken to me of this form of monstrosity in terms of admiration is so large in comparison with those who have treated it as it deserves, that at times I have felt disheartened and ready to despair of ever finding a more elevated standard of public taste.

H. W. S. CLEVELAND.

Minneapolis, Minn.

—*Garden and Forest*, July 31.

[Ah, there's the rub! Crowds flock to view these "floral eccentricities" while giving barely a glance to the other very attractive features of the park. And these crowds include people of education and refinement as Mr. Cleveland has shown. And the daily press heaps praise without stint upon these "monstrosities." While we do not favor this style of gardening we fail to see the necessity for any violent "denouncements" of it. It is attracting to the parks many who would not otherwise go, and in this way is doing good. Let us have patience. We are still infants in the art of gardening.—ED. A. F.]

Catalogues Received.

Jas. M. Thorburn & Co., New York,
Holland bulbs; Damman & Co., San
Giovanna a Teduccio, Italy, bulbs and
orchids; E. H. Krelage & Son, Haarlem,

Detroit,	J. R. & A. Murdoch.
J. Breitmeyer & Sons.	St. Louis, Michel Plant
Hamilton, Ont.,	& Seed Co.
Webster Bros.	San Francisco,
Harrisburg, Pa.,	Thos. A. Cox & Co.
J. Horace McFarland.	Toronto, Ont.
Louisville, Ky.,	J. A. Simmers.
George Thompson &	Washington, D. C.,
Sons.	L. Schmidt & Sons.

SYRACUSE, N. Y.—P. R. Quinlan & Co. have added a new house 125 x 25.

GRAND HAVEN, MICH.—Geo. Hancock has added another house 100 x 20.

EGGERTSVILLE, N. Y.—R. E. Baetger has built a new carnation house 100 x 20.

SANDUSKY, O.—Florist Wm. Dilger will give a chrysanthemum show at Fisher's Hall, November 7.

MILWAUKEE.—Clark Bros. have gone out of business. It is reported that the property which they occupied has changed hands and that the greenhouses will be torn down. Jacob Schiner has rented ground and greenhouses of E. Schoiders on the Port Washington road. Fred Schmaling has added three new greenhouses and has severed his connection with the Calvary Cemetery. It is understood that he intends to open a retail store in the city also.

GREENHOUSE HEATING.—The Herendene Mfg. Co., Geneva, N. Y., send us a copy of a neatly gotten up little book of 100 pages containing an essay on greenhouse heating, directions for piping greenhouses for steam heating and several tables giving surfaces and capacities of pipes and the number of feet of pipe necessary to heat a given amount of space. There is also a very good engraving showing method of piping, in addition to a catalogue of their boilers.

☉Re Seed Trade.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. McCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1896.

VINE SEED crops are said to be doing well in Nebraska.

JEROME B. RICE is at the Thousand Islands with his family.

MR. J. H. MUNSON is now with L. L. May & Co., at St. Paul, Minn.

HIRAM SIBLEY & Co. have completely closed out their seed business at Rochester.

THE PEA CROP is said to be only a moderate one and beans almost a failure in many sections.

IT IS RUMORED that a corporation has been formed of the Geo. S. Haskell affairs and that a 25 per cent cash dividend will be paid to creditors.

MR. J. E. NORTHRUP returned from Europe July 28 in the Guion Steamer Arizona. He complains at the lack of elevators in London and Paris.

MR. FREDERICK HOWCROFT, of Howcroft & Watkins, London, sailed for Europe on having made a week's trip through the principal American seed centers. Mr. H. has invented an automatic letter receiver, which is likely to bring him a handsome fortune. This was his eighth visit to America.

News Notes.

LINCOLN, NEB.—C. H. Fry is building three new houses.

SANDUSKY, O.—Wm. Dilger has added a new house 56 x 11.

ARLINGTON, MD.—A. Cook, Jr., has added a house 100 x 16.

GLENVILLE, O.—L. A. Schmitt has built a new house 70 x 16.

HAMPDEN, MD.—M. A. Hauske has built a new house 70 x 12.

WASHINGTON.—C. F. Hale has built another rose house 230 x 25.

OAKLAND, MD.—Henry Webber has built two new houses 60 x 22.

COLUMBUS, O.—John B. Romans is building three large new houses.

CUMBERLAND, MD.—Bopp & Co. have added three new houses 75 x 11 each.

ASHTABULA, O.—Chas. H. Bliss & Son have completed one new house 86 x 20.

POTTSVILLE, PA.—J. Keim & Son have erected two new houses 80 x 20 and 100 x 12.

PORT HOPE, ONT.—John Hume has completed a new warehouse with office.

ALLEGHENY, PA.—Fred Burki has built two houses 100 x 20 and one 75 x 20.

ST. ALBANS, VT.—Geo. Cook has built one new house 54 x 22, heated by hot water.

YORKVILLE, N. Y.—Geo. H. Benedict has built four houses 100 x 14 each, heated by steam.

PORTSMOUTH, VA.—Mrs. M. F. Dougherty has completed two houses 14 x 60 and one 42 x 10.

DETROIT, MICH.—J. Breitmeyer & Sons have now 45,000 feet of glass at Mt. Clemens, Mich.

GENEVA, O.—J. M. Simmons is preparing to build two more houses 50 x 20 and 80 x 20 respectively.

WACO, TEXAS.—The annual meeting of the Central Texas Hort. Society was held here July 16 and 17.

BUFFALO.—John Brauer has built a new house 110 x 16. Bischoff & Sprissler have added a new office 25 x 15.

GRAND RAPIDS, MICH.—Henry Smith has added two houses 90 x 20, and is preparing to put in a new steam boiler.

SAN FRANCISCO.—At the last meeting of the Floral Society it was decided to hold the fall exhibition of the society in October.

FINDLAY, O.—M. B. Patterson has added two houses, one 110 x 20 and the other 110 x 10. Natural gas is used for fuel.

ATLANTA, GA.—At the meeting of the Atlanta Hort. Society July 21 there was an unusually excellent display of plants and flowers.

ELYRIA, O.—Sears & Co. have added two new houses 70 x 12 each, heated by steam. A. J. Graham has completed five houses 50 x 12.

KALAMAZOO, MICH.—Mr. S. C. Cobb has resigned his position as superintendent of the cemetery after 20 years of faithful service.

NEW CASTLE, PA.—Paul Butz & Son are building four new rose houses, two 25 x 100 and two 16 x 100, to be heated by steam, using natural gas for fuel.

SARNIA, ONT.—The mayor and commissioners recently visited Belle Isle Park, Detroit, preliminary to arranging for the laying out of a 35 acre park here.

ALLEGHENY, PA.—Theo. Becker has built a new rose house 104 x 24. He has also added nine frames 66 x 7 which are arranged to be heated by 2-inch steam pipes.

COLORADO SPRINGS, COL.—Wm. Clark is building two new houses, one 22 x 65 and the other 20 x 100, both for roses. S. D. Bradford is adding a violet house 65 x 12.

NEW BEDFORD, MASS.—The Gardeners' and Florists' Club intends to hold a flower show early in September and has arranged a very liberal premium list for the same.

PITTSBURG—E. W. Williams is building two houses 80 x 20. Natural gas will be used for fuel. Chas. T. Siebert has finished a rose house 180 x 18 and will build another 165 x 20.

BALTIMORE.—Regarding your note that John Donn was preparing to move his greenhouses your informant was in error. Mr. Donn has no thought of changing from his present location.

DALLAS, TEXAS.—R. Drumm & Co. are building a floral store with greenhouses attached, on Main street. They are also building a new rose house 18 x 100 at their place in Fort Worth.

PITTSBURGH—A. W. Smith has built five houses 67 x 11, heated by natural gas. P. C. Erdman has finished one house 100 x 22. A. Cook, Jr., Lafayette avenue, has built a new house 100 x 16.

BUFFALO.—At the last meeting of the local club, held July 27, an interesting paper on overhead heating in greenhouses by E. S. Bartholomew, Westfield, N. Y., was read and discussed.

SPRINGFIELD, O.—McGregor Bros. are adding three more houses 125 x 20 each, giving them now 50,000 feet of glass. Wilson Bros. have completed six houses 60 x 10, one 60 x 16, one 20 x 11 and one 64 x 12.

LAKE GENEVA, WIS.—The hail storm of July 27 did considerable damage here. Thos. H. Price had over 800 feet broken and others had quite a lot of glass smashed. Some of the hail stones were three inches in diameter.

CHESTER, PA.—Thos. F. Delahunt has re-opened and fitted up the store formerly occupied by the Chester Floral Co., at 613 Edgmont avenue, and is building another rose house 100 x 20 at his place at 13th and Potter streets.

COLUMBUS, O.—G. Drobisch has added one house 20 x 100 and three 11 x 106 each; J. R. Hellenthal two 75 x 10 each; Julius Drobisch three 65 x 15 each, and Franklin Park Floral Co. two 115 x 18 and two 115 x 12 each, heated by steam.

RICHMOND, VA.—W. A. Hammond has built two new houses 100 x 20 each, and is preparing to erect another 200 x 20. J. J. Harvery has finished a palm house 30 x 20. Mrs. A. E. Grant has completed five houses 100 x 20 each with packing room 60 x 20, heated by steam.

BALTIMORE.—The new palm house in Druid Hill park is 50 x 50 feet and 63 feet high with an annex 20 x 23 feet. It is entirely of stone, iron and glass, except some wood work in the sashes. It was originally intended to have two wings built to the house, but action in that direction has been indefinitely deferred.

BALTIMORE.—J. G. Erdman has completed a new house 100 x 22. At Govans-town Brackenridge & Co. have added a rose house 100 x 16, and Isaac Moss one 100 x 20. At Waverly O. J. Wight has added two houses 100 x 12 and 100 x 18 respectively; C. Hess one 100 x 20; Joseph Wolf three 100 x 20 each. R. Schmidt has added two 70 x 18 and will erect another 120 x 40.

THE WEST SHORE RAILROAD TO THE BUFFALO CONVENTION.

THE WEST SHORE RAILROAD offers the direct and most popular route between
NEW YORK and BUFFALO to the florists who contemplate visiting Buffalo at the time
of the next convention, August 20 to 24, 1889, inclusive.

As a scenic route the "West Shore" is unsurpassed, passing as it does through the
magnificent scenery on the west bank of the world famed HUDSON RIVER and the
picturesque MOHAWK VALLEY. A view of these scenes alone is worth many times
the cost of the journey.

The equipment in luxurious appointments and elegance of finish is unsurpassed.
Magnificent Drawing Room and Sleeping Cars on all through express trains between
NEW YORK and BUFFALO. No extra fare charged on any through fast express trains.
The lowest rates of fare authorized will be granted to florists purchasing their tickets
to Buffalo and return via West Shore Railroad.

Florists from BOSTON and NEW ENGLAND points can secure through Sleeping Car
accommodations to Buffalo via Fitchburg (Hoosac Tunnel Route) and West Shore
Railroads. The Fitchburg Railroad is the only line running Sleeping Cars through
between Boston and Buffalo in connection with the West Shore Railroad.

The following condensed time table shows departure of West Shore Trains from New York and
intermediate points, and the arrival of these trains at Buffalo:

	P.M.	A.M.	A.M.
Leave New York (ft. Jay St., N. R.).....	* 5.00	* 9.40	† 3.10

HERENDEEN Mfg Co., Geneva, N. Y.

Ants and Mealy Bugs.

We would be pleased to be enlightened as to what connection ants have in the formation of scale and mealy bug on plants. Have noticed that where there is a number of ants on plants we invariably find scale and mealy bug, while on plants not molested by ants we are not troubled with either scale or mealy bug showing that the ants must have something to do with forming one or both of these pests. Will some one please shed a little light on the subject and indicate the speediest way to get rid of the ants?

J. H. WADE & Co.

[The ants have nothing to do "in forming one or both of these pests," they are merely attracted to them by the "honey" or excreta which they deposit, and which the ants feed upon. And in order to increase this field of honey the ants do carry mealy bugs, aphides, etc. from one part of the plant to another, to colonise them there as it were. But if you keep your plants perfectly clean from parasitical insects as scale and mealy bugs, ants will never trouble them above ground.]

SMILAX.

Extra fine plants, twice cut back, from 2-inch pots, \$3.00 per 100; \$25.00 per 1000. 5 in at 100, \$50 at 1000 rates.

JAS. BACKHOUSE & SON

THE NURSERIES, YORK, ENGLAND,

invite the attention of the American trade to the following *SPECIAL STOCKS*, for which they have long been famous:

ORCHIDS.

Comprising Cattleyas, Laelias, Odontoglossums, etc., which they offer in established plants by the dozen, hundred or thousand. Disas (the finest stock of flowering plants in Europe), and other popular genera in choice leading kinds together with many rare and unique varieties.

FERNS.

These have long been a specialty, and our stock of Tree Ferns, Filmy Ferns, Gleichenias, Maidenhairs, and other popular kinds, is unsurpassed. Very moderate quotations can be given for grand specimen Tree Ferns; and for other kinds by the dozen, hundred or thousand.

Stove and Greenhouse Plants.

The leading kinds in large quantities. Special stocks of Red and White Lapaerias; specimen Camellias in all sizes, including large plants of Double Whites; Imantophyllums (Clivias), Eucharis, Azalea rosea flora and other fine varieties, Rhododendrons, etc.; together with extra strong plants of stove and greenhouse Climbers.

Alpine and Herbaceous Plants.

For many years we have given special attention to gathering together an extensive collection of the most popular plants of Old English gardens; whilst our collectors and correspondents in the Alps, Pyrenees, Tyrol and other mountainous districts of Europe; as well as in Asia Minor, the Caucasus, Turkestan and Siberia, India, Japan, Australia and New Zealand, have enriched our stock, which for extent and variety is unsurpassed in the Trade. Of Auriculas, Campanulas, Delphiniums, Fritillarias, Narcissi, Phloxes, Primulas, Pyrethrums, Spireas, Iris, Hellebores, etc., etc. We cultivate the choicest kinds in large quantities.

Evergreen & Flowering Trees & Shrubs in the best and hardest varieties are extensively cultivated, including North American, Japanese and other CONIFERAE which our soil and climate admirably suit. Also Hardy Climbers in great variety.

FRUIT TREES

are also largely grown in the best and most productive sorts.

VEGETABLE SEEDS.

Peas, Broccoli, Cabbage, etc., of the newest and best varieties.

Our representative, MR. S. MARSHALL, expects to visit the States, arriving about end of July, and will be happy to wait upon purchasers, or send special quotations on application. Address, GRAND CENTRAL HOTEL, NEW YORK CITY.

Chicago.

R. J. Donovan's new plant at High Ridge consists of five houses 100 x 15 each and one 100 x 12.

Nick Henson, of Lake View, has built four houses 120 x 20 each, heated by hot water.

S. Muir has bought 12 lots in South Englewood and intends to eventually build some greenhouses on them.

At Park Ridge H. E. Redelings is building two carnation houses 120 x 10 each. M. Lemke is building a rose house 100 x 10, and one for carnations 100 x 16. J. T. Janes is building a new house 100 x 10. E. Weinhoeber & Co.'s eight new houses are 100 x 20 each.

At Lake View Geo. Wittbold has built four new houses, two 50 x 16 and two 100 x 16, for palms and ferns.

The West Park commissioners have had plans drawn for the construction of a second Champs Elysees and have appropriated \$31,000 to have the plans carried out, \$5,000 of which will be expended this fall. The work is to be done in connection with Union Park, in which great changes will be made. In Douglas Park conservatories are being erected at an expense of \$30,000, and additional improvements are being made at an expense of \$10,000. The sum of \$20,000 will be expended on improvements in Garfield Park, the same in Humboldt Park and a like amount divided among the four small parks on the west side.

PANSY SEED. NEW CROP.

Orders booked now for prompt delivery at the following special rates:

TRIMARDEAU, choicest French mixed, unsurpassed in brilliancy of color and size of flowers, some measuring from 3 to 4 inches across. Price, per lb. \$2.00, ½ oz. \$2.50, ¼ oz. \$1.50, 1/8 oz. \$1.00.

Trimardeau, golden yellow, ½ oz. \$1.50, 1/8 oz. \$1.00.

TRIMARDEAU, spotted, large flowering showy Pansies, somewhat smaller than Trimardeau, but of even more exquisite markings and richer colors, pronounced by many the finest strain produced yet. This variety produces few seeds and is very scarce. Price, per lb. \$4.00, ½ oz. \$5.00, ¼ oz. \$4.50, 1/8 oz. \$5.00, 1/16 oz. \$2.00.

CASSIERS, 3 and 5 blotched Giant, extra fine. Per 1/4 ounce \$5.00, 1/8 oz. \$2.00.

FAUST, King of the Blacks, fine for bedding. Per ounce \$1.00.

White and Yellow, fine strain. Per ounce 75c.
Emperor William (blue). Lord Beauchamp (purple). Per oz. \$1. Fine German mixed, lb. \$5 oz. 50c.
Improved, large flowering mixed, lb. \$10, ½ oz. \$1.

— AND —

BUSH HILL PARK NURSERY,

ENFIELD, ENGLAND.

Everything for Florists.

My Greenhouses covers now two acres solid in glass. Having built and rebuilt them in the best possible style with iron rafters, iron posts and iron supports for benches, using mostly large double thick glass, thus requiring very little wood and giving all the light and air possible, and having divided my establishment in several departments, each with a competent manager, I am enabled to supply the retail florist the coming season with everything that he needs, thus assuring him fresh stuff and lessens greatly his expenses for ordering and freight. I have planted 25,000 Roses of the best varieties, including Woottons, also 5,000 best Hybrids, 10,000 each of Carnations and Violets, 3,000 each of Bouvardias, Primulas, Mignonette, Daisies, Pansies. Also quantities of Allamanda Schottii, Poinsettia, Eucharis Amazonica and Orchids. Will have also large quantities of the best varieties of bulbous flowers, as well as Smilax, Asparagus and Lygodium Scandens.

My Decorative Department contains large numbers of Palms, Dracaenas, Crotons, Pandanus, Ferns, etc., which will be ready in time for next season's use. Will also have a large stock of the best varieties of Roses, Geraniums, Carnations, Fuchsias, etc. for florists' stock.

READY FOR SALE NOW.

PALMS—Corypha Australis and Seaforthia Elegans, 5-inch pots, 18 inches high, 8 fronds, \$6 per doz., \$40 per 100, \$350 per 1000. Areca Sapida, 5 inch, and Cocos Campestriis, \$10 per doz.

FERNS—Adiantum Fulvum, 4-inch, \$8 per 100, and Nephrolepis Philipene, 4 inch, \$15 per 100.

Twenty good varieties of ferns in mixture, from 2-inch pots, \$5 per 100. For winter flowering, Eucharis Amazonica, 20 bulbs in an 8-inch pot, \$1. Gardenia Florida, Allamanda Schottii and Clerodendron Balfouri, from 5-inch pots, \$3 per doz. CUT ROSES—in mixture, \$3 per 100. Lygodium scandens, fine strings, 20c. each.

Canna Flaccida.

Do the florists of America know this lovely native canna? Last season I saw C. flaccida mentioned in high praise several times, but "a burnt child dreads the fire" so I bought charily, but after one season's trial I must say that the half has not been told. The flower is a rich canary yellow, very large and elegantly formed, resembling an orchid more than a canna, and if placed among a collection of orchid blooms I believe it would pass as a member of that family. A single bloom plucked to-day measures just seven inches from ovary to tip of petals. The plant is dwarf in habit, none growing over 2½ feet high, with long narrow lance shaped leaves. I have read that it is hardy in northern states.

HUGHES'**SOLUBLE FIR TREE OIL.**

FLORISTS AND NURSERYMEN SHOULD
NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants: such as ferns, etc., if used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

Tremont House, Washington and Seneca Sts. 60	60	1.50
Brunswick Hotel, Exchange and Wash. Sts. 50	50	1.50
Fillmore House, Michigan and Carroll Sts. 40	40	1.50

Applications for rooms may be made direct to the hotels, or to Thomas Clayton, chairman hotel committee, 90 Richmond avenue, Buffalo, N. Y.

DON'T FAIL to register with the Buffalo club.

DELAWARE AVENUE is one of the most beautiful avenues in the country.

DON'T FORGET to have Secretary Stewart countersign your R. R. certificate.

SEE OUR MAP showing all the hotels at which rates have been secured, depots etc.

IT IS a peculiar fact that Mr. Long is rather under than above the average height.

ATTEND the meeting to organize a National Chrysanthemum Society Tuesday afternoon.

BUFFALO BILL can be found at 479 Main street. His wild west show will be at the ball game.

UP TO August 7 2,000 square feet of space in the exhibition hall had been engaged and allotted.

THE MEETINGS will be held in the "Concert Hall," Music Hall Building, Main street. See map.

THE AMERICAN FLORIST headquarters will be at the Tift House, room 172, adjoining society headquarters.

A BOWLING TOURNAMENT has been arranged for. This and the ball game will undoubtedly furnish much sport.

THE BASE BALL GAME promises much sport. The local nine has been in steady practice and it behooves the visitors to select their best players.

MEMBERS arriving at Buffalo in whatever numbers will be met at the depot if they will notify T. Clayton, 90 Richmond avenue, chairman of the reception committee.

A NATIONAL MICROSCOPICAL CONVENTION will be in session the same dates as that of the S. A. F. This should prove an additional attraction to any interested in that science. They are arranging for a public exhibition or reception on Thursday evening.

THE BUFFALO FLORISTS' CLUB has a room at the Tift House, adjoining the headquarters of the S. A. F. They desire every one in attendance at the conven-

tion to register with them. Members of the Buffalo Club will be known by a white badge bearing crest of a buffalo head.

VICE PRESIDENT W. J. PALMER has a simple device for fumigating, which does its work most effectually and costs only about 25 cents to make. He will explain the method of using it at the meeting Tuesday evening. Any florist can get one made after seeing the sample, which will be on exhibition. The device is not patented.

THE NATIONAL MICROSCOPICAL SOCIETY, which will give a public reception and exhibition on Thursday evening at the Buffalo Library Building, has fra-

ternally extended an invitation to the S. A. F. to attend. The rooms of the Historical Society and those of the Society of Natural Sciences will also be thrown open on that evening.

THE EXCURSION TRAIN to Niagara Falls will leave at 8:30 a. m. sharp, Friday from Union Depot. The run to the falls will be made in 45 minutes, giving from four to five hours at the falls, arriving again at Buffalo at 2 p. m. for the collation tendered by the Buffalo Florists' Club. This will be followed by a carriage drive through the parks and residence streets, starting at 4:30 p. m. and finishing by 7:30 p. m.

PROGRAMME.

TUESDAY, AUG. 20, 1899.

FIRST DAY—MORNING SESSION, 10 O'CLOCK.

Address of welcome, Hon. Philip Becker, Mayor of Buffalo—Response, Mr. A. P. Calder, Boston—President May's Address—Reports of Secretary and Treasurer—Reports of Standing Committees—Reports of Special Committees—Miscellaneous Business—Discussion of President's Address.

FIRST DAY—EVENING SESSION, 7 O'CLOCK.
ESSAY—*Roses*: W. C. BARRY, Rochester, N. Y.

Discussion.

QUESTION BOX.

ON ROSES.

What varieties of roses of recent introduction are specially useful to the florist? Reply by E. G. Hill, Richmond, Ind.

Will the Rose-bug commonly found in greenhouses survive freezing? Reply by Chas. P. Anderson, Flushing, N. Y.

Southern green Rose Bushes. A. C. Oelschig, Savannah, Ga.

What is the best way to keep Green-fly from Roses without fumigating?

Where does the Rose-bug deposit its eggs?

Perles and other Roses on the Banksia and similar stocks—are they preferable to those on own roots?

MISCELLANEOUS.

The influence of soil on Carnations—what is the effect of transplanting from light to heavy soil, or vice versa? Reply by Wm. Swayne, Kennett Square, Pa.

What are the best varieties of Azaleas for Christmas blooming?

What is the best method of raising fine Mignonette in winter?

Can any of the following plants be profitably grown in winter for cut flowers: *Rogiera cordata*, *Rondeletia speciosa*, *Hemerocallis*, *Ranunculus*, *Anemone*, *Aster*?

Winter blooming Heaths.

What is to be recommended as new or promising for the cut flower trade?

WEDNESDAY, AUG. 21, 1899.

SECOND DAY—MORNING SESSION, 9:30.

Selection of place of meeting for 1899—Nomination of officers for ensuing year.

ESSAY—*Elevation of our Business*, ROBERT CRAIG, Philadelphia, Pa.

Discussion.

ESSAY—*Education*, H. H. BATTLES, Philadelphia, Pa.

Discussion.

SECOND DAY—EVENING SESSION, 7 O'CLOCK.

ESSAY—*The Establishment of an Experimental Garden*, JOHN THORPE, Pearl River, N. Y.

Discussion.

QUESTION BOX.

What are the necessary qualifications for properly filling the following situations: 1. Grower in commercial greenhouses. 2. Head gardener on a private estate. 3. Florist in a public institution. 4. Superintendent of public parks and grounds. Reply by Peter Henderson.

Is the sale of flowers in the streets of large cities an injury to the general business of the stores? Reply by F. M. Huntsman.

Is the practice of advancing prices of cut flowers on special occasions injurious to the trade. Reply by J. C. Vaughan.

What per cent over cost should be a general basis for prices in conducting a retail cut flower trade. Reply by John Westcott.

How can local clubs and the national society best work together to promote their common interests? Reply by J. D. Reynolds.

Can the general florist engage to advantage in the hardy plant and shrub business for lawn decoration? Reply by Wm. Scott.

Palms, ferns and decorative plants, their value in floral decorations. Reply by M. H. Norton.

It what way can a florist most successfully start in business in a country town?

What hardy and half-hardy plants may be used for decorative purposes in severe weather?

Can the Society do anything to regulate the prices of bedding plants throughout the country?

THURSDAY, AUG. 22, 1899.

THIRD DAY—MORNING SESSION, 9:30.

Election of officers.

ESSAY—*Useful Summer Blooming Flowers*, A. E. WHITTLE, Albany, N. Y.

Discussion.

ESSAY—*Horticultural Exhibitions*, EDWIN LONSDALE, Chestnut Hill, Pa.

Discussion.

THIRD DAY—EVENING SESSION, 7 O'CLOCK.

ESSAY—*Landscape Gardening*, WM. McMILLAN, Buffalo, N. Y.

Discussion.

ESSAY—*Orchids, The Natural Habitat of the Leading Varieties*, J. FORSTERMANN, Summit, N. J.

QUESTION BOX.

What is the best method of caring for wrought iron boilers when not in use? Reply by M. A. Hunt, Terre Haute, Ind.

What are the results of experiments with water gas? Reply by J. T. Temple, Davenport, Ia.

What are the advantages of the electric light?

What is the experience in the use of petroleum?

Best method of packing plants for express?

Materials for flues?

How to prevent waste in fuel?

FRIDAY, AUG. 23, 1899.

FOURTH DAY.

The fourth day will be devoted to social enjoyment. The great feature of the day will be an excursion to Niagara Falls, 23 miles distant from Buffalo. The Buffalo Florist Club will arrange for an excursion train, and procure lowest rates for trip and incidentals at the Falls. On return to the city a collation will be tendered the Society by the Buffalo Club. A large hall, capable of seating the whole company at once, will be provided. A base ball game and other diversions will follow.

Leaves of Advice From a Limb of the Law.

(For Young Florists.)

VII.

Take care! Take care! Those pots are of the earth, earthy. You've broken three or four already.

Yours are they? Suppose they are. That's no reason why you should smash them into pieces. Besides they are not yours absolutely. Your creditors have an interest in them.

No man can own a thing absolutely. Somebody else will be able to prove a qualified ownership in it. No, decidedly not; a man's house is not and never was his castle. He must open the door when the law knocks; he must pay his taxes or move out; he must maintain no nuisance, commit no unlawful act therein. The state may decree its removal if the ground be needed for the public good—of course upon the payment of a fair price. You may not store explosives therein.

By the way, speaking of explosives, why are you in such an explosive condition of mind this morning? Ah, indeed; so your "fool boy" as you call him, pulled down a pile of heavy flower pots on himself and broke his leg, did he? But why should that put you into such a fit of passion? It wasn't your leg. I should think you would be in a calm and sympathetic condition of mind.

Oh ho! Sent a lawyer to you has he? Wants damages does he? Claims those heavy pots were piled up on a thin, weak self does he?

Not a cent, hey? Not a —, take care, take care, be calm; bear in mind that it wasn't your leg. Don't forget that.

My advice. Well, how am I to advise you as long as you keep up that disagreeable pounding. That's it, unbutton your waistcoat, loosen your collar, take off your hat and draw a deep breath. Now, let's see how the law stands: If that self can be proven to have been weak and insecure, my advice is: Go to the boy's house, assume all the expenses of doctor and nurse; say a kind word to the boy and promise to make it all right when he gets well.

The law is firm on this point. "It is the duty of an employer to know all the defects existing in the instrumentalities of his business." Mark the language well. "All the defects." That is but one qualifying clause, and there is "which human foresight can remedy and prevent." The law expects no man to pierce the dim future and make ready for a shower of fire by covering his roof with an asbestos blanket. If a man's business be extra hazardous, which yours is not, it is his duty when employing a workman to set forth in the plainest and most striking manner all the dangers to which the work will expose him and to instruct him how to reduce that danger to a minimum. Especially must he warn his employee against all hidden or latent dangers.

For instance, it is your duty to warn your workmen against touching, handling or carrying to their lips any poisonous plant or plants which may be growing in your hothouses; or if you make use of any poisonous substance such as corrosive sublimate, Paris green, etc., to destroy vermin, it becomes incumbent upon you to warn your workmen in the most solemn and impressive manner as to the danger of using such substances in any way or manner except as directed by you.

The younger the employee the more careful must you be in your watchfulness. In fact, if under the age of 14 the law would be slow to excuse you, no matter

MUSIC HALL BUILDING, BUFFALO, IN WHICH THE CONVENTION WILL BE HELD

how solemnly and frequently you warned a boy to be careful in using such a poisonous substance.

Now when a defect does exist such as this weak shelf, it becomes the duty of the employer to remedy the defect at once or take the consequences. It will not do to plead that this or that interfered to prevent you from making the necessary repairs. Better be silent than advance such a wretched excuse.

You say the boy knew that the shelf was overloaded. This will not excuse you. It was necessary for him to pass and repass that very spot twenty times a day. No doubt you are right. No doubt as you say he lost his balance and without thinking reached up and caught hold of the shelf. The extra weight did the business. The shelf gave away and precipitated the whole pile of heavy pots down on him.

No, there is no "contributory negligence." He had a right to suppose that a few pounds more would work no damage, and had he set a heavy pail on the shelf it would not have been "contributory negligence." He had a right to assume that so long as there was room on that shelf it was not overloaded. An employee is only bound to know what he ought to know. You are not to assume that he will test the apparatus in your trade, that he will pause in his work and make experiments as to the trustworthiness of the instrumentalities of your business. Nothing of the sort. That would be expecting the intelligence of a philosopher in the commonest mortal.

Give you an example of "contributory negligence?" Good. I will do so. I like to have you ask questions. It shows that your mind is not in the same condition as those morning glories are at this moment—asleep. Well, let us suppose that you provide a tool house with the proper hooks, etc. for edged tools, but that your boy instead of taking the

trouble to hang a sickle up in the tool house hangs it up near the door of this greenhouse and that you coming in in the dark and reaching up for something knock the sickle down and it strikes the boy on the head inflicting a deep wound. He could recover nothing. He was the author of his own misfortune. He contributed toward the accident. It would not have happened without his negligence.

But bear in mind that you as employer are not called upon to assume the ordinary risks of a business. A workman who falls sick from exposure to heat or cold, who contracts a fever while assisting in opening or closing a sewer, who crushes a finger while moving a heavy box etc. has no redress.

These "ordinary risks" sometimes become extraordinary. For instance, when a man accepts work in a powder mill, enters the employment of a looking-glass maker or metal polisher, etc.

Now, of one thing you must disabuse your mind. Don't get an idea that because this person who has been injured by your negligence is a poor boy to whom you paid a dollar or so per week, that the law will in any way be inclined to give him less damages. He will be entitled to as much consideration as though he were the son of your richest customer.

Yes, contracts have been made and upheld by the courts by means of which employers have bound their workmen in case of accidents to make no claim for damages. Of course there must be a consideration. The law looks with distrust upon such contracts, for a man is often forced into signing one in order to get work to keep body and soul together.

Certainly such a contract would not shield a man from gross neglect of duty in keeping his machinery in repair etc. Anyway, you could not make such a contract with a boy—a minor. The law would disregard such an attempt. Until

a person reaches his twenty-first year he will not be allowed to sign away any of his civil rights, no matter how large the consideration.

That's right, go and see how the boy is getting along. Settle the bills for doctor services, etc., but don't pay any damages unless I am with you.

UNCLE BLACKSTONE.

Cost of Production.

Considerable of late has been said in the *FLORIST* about the cost of raising plants for market, some of the estimates given being so low that judging from the credit side of our ledger we about conclude that we put more labor into the growing of plants for market than is really necessary, and that our present system of plant growing must be deficient somewhere.

For the last five years I have kept a correct account of the actual cost of everything connected with my florist business, and can tell exactly how much it costs for labor, fuel, pots, manure, repairing and tools necessary for running the same, also the prices at which the different kinds of plants have averaged when put on the market. Of course my business is comparatively small, plants being raised mostly for the local retail trade, which demands flowering plants to be in bloom and foliage plants to be larger than what are raised for a shipping trade.

My sales of such plants for the last two years have run between 40,000 and 45,000 and in order to get this number fit for market I have to raise from 5,000 to 10,000 more especially of flowering kinds. Geraniums, fuchsias, heliotropes, ageratum and similar flowering plants are grown in 3, 3½ and 4-inch pots and retail at from \$1 to \$1.25 per dozen. Verbenas, coleus, alternantheras and basket plants are grown in 2½-inch pots and retail at 50 cents per doz.

In making my estimate of what these plants cost me I have put my land at its lowest market value, also cost of buildings, and charge on the same interest and taxes besides the expenses of maintaining the same; and as I grow the different kinds of plants in separate houses and most of the houses being heated separately, gives me a good chance for knowing what each kind costs.

Geraniums and fuchsias in 4-inch pots in bloom costs on an average 4½ cents each, in 3-inch 4 cents; heliotrope and ageratum in 4-inch 3½ cents, in 3-inch 3 cents, also in bloom; verbenas, coleus, ageratum and the general run of basket plants cost about 2 cents each.

Where plants are raised by the 100,000 and sold when about well rooted in large quantities the cost of raising is small, but where every plant has to be grown as an individual specimen and in full flower they require more space and require it longer than such as are raised for the wholesale and mailing trade. It is this occupying of space so long that increases their cost. Of course since we have adopted the hotbed for growing plants, as early in the spring as possible, has decreased the cost considerably, as all kinds of flowering plants come into bloom in a shorter time in a hotbed than in a greenhouse and also retain a healthier appearance. As we raise most of our verbenas now from seed the cost of raising plants fit for the market has also been considerably lowered, they do not occupy the greenhouse space so long, nor do we have any loss from rust.

Youngstown, O. M. MILTON.

SYRACUSE POTTERY CO.

"Ready packed crates" are our specialty. The "CASH CRATE" for cash with order, and the "CREDIT CRATE" when paid in fifteen days. Notice the number in each crate. THE "ACME" WATER HEATERS

A NEW AND THOROUGHLY EFFICIENT MEANS OF

Economical Heating by Hot Water.

The manufacturers of these boilers desire the closest inspection by practical engineers, and stand prepared to demonstrate that the **ACME** will heat more pipe and do so with less fuel and attention than any other boiler on the market.

Proficient engineers will tell you that the Acme has the largest direct heating surface ever put in a boiler. To get out this opinion take the cut of the Acme, and as many others as you can find, and have the matter thoroughly digested. There is no other boiler on the market with

Triple Return Flues, and an Interior of an unbroken Upward and Outward moving body of the heated water.

The fire in this boiler is staggered to utilize all the heat, but the heated water is permitted to escape quickly and freely.

The advertiser stands prepared to demonstrate that this boiler will heat more glass, and do it with less fuel and attention than by any other method known—Steam or Hot Water.

Do not forget your future Coal Bills and present interest, but write for particulars to

THE ACME WATER HEATERS,

60 to 70 Pine Street, **POUGHKEEPSIE, N. Y.**

THE MANY COMPLIMENTS paid the FLORIST by our readers when renewing subscriptions are hereby acknowledged. While we do not think it wise to fill space by printing even a small selection of such we wish to say that the commendations are thoroughly appreciated and stimulate us to renewed efforts to please.

THE BUFFALO MEETING.—From its inception the Society of American Florists has been a chosen mark of the critics. At first they would hardly allow it a twelve month in which to die and be buried. When that period had passed, a rousing meeting closing the year, and a new prediction must be hazarded they saw swift decay in the rule of cliques and in other dimly outlined evils. But each succeeding yearly convention has overshadowed its predecessor. The fifth annual meeting just closed has proven no exception in its disappointment of this class. They said the end had been reached and all the changes rung, the florists had learned all the society could teach. What a further disappointment will it be then to know that the universal opinion is that in all that makes the

gathering of real benefit to the florist the last is still the best. The well arranged and complete programme, secured and carried out to the letter, the change to two daily sessions, the hall and hotel conveniences all combined to name it a model convention.

The Buffalo Convention.

It is pleasant to record that the fifth annual meeting of the Society of American Florists was more successful than any previous one. The essays were uniformly excellent; not one was of doubtful interest, and the discussions brought out many facts of great value. The convention hall was most satisfactory, being of just the right size and with excellent acoustic properties, which resulted in a larger and more constant attendance at the meetings and a freer discussion of the various essays.

The address of welcome by the Mayor of Buffalo was responded to by Mr. A. P. Calder, who said that the convention came to the city as a grand educator and exponent of advanced ideas, to teach and to learn. That the members came not only from the east, west and south, but from Canada as well, and called attention to the Stars and Stripes and Union Jack, which were draped together on the wall.

Then followed President J. N. May's address, the major part of which is given below.

"Ladies and Gentlemen:

For the fifth time we have met in convention for the express purpose of instruction and mutual intercourse, and it affords me very great pleasure to-day to say to you all that our society, though young, is growing and flourishing; long may it continue to do so, and each every year become more useful, more instructive and we do this in no way better than by advancing and elevating our business. To advance the best interest of all we must elevate our business and our standing in the commercial world; as workmen and artists we must show that we are able to keep abreast of the times, and the best possible opportunity for us to do so is to meet, as we are doing here to-day, and freely discuss all matters of interest; for there are collected here to-day many of the brightest minds of the country, whose ideas and views will be of immense value and help to us. No one can deny that wonderful strides have been made in the making up of floral designs alone, within the last ten years, and hundreds of other branches of our business have shown equal advancement. This is as it should be, and that we have advanced so rapidly in many of these things is very largely due to the Society of American Florists; but no one will deny that we have ample room for improvement left. Let us then all unite and try to carry on the good work, for to elevate our business is to

raise each and all of us on the plane of life. It may be well to consider for a moment what elevating our business means.

"It means, my fellow members, higher art, broader views, honorable and strict integrity in all our dealings, and I know of no better means of advancing our calling to this plane than the education of our young men, and our children also, who are to succeed us in this business; by the term education, I touch upon a very vital subject, and though following somewhat in the footsteps of my worthy predecessors, I cannot help referring to it again. To my mind, I think we, who are conducting the florist business of to-day, should very seriously consider it for the good of posterity. As we train the young men and boys now in our employ, so in a great measure will they conduct the future business. Therefore we should be careful to start right. If we conduct our business in a strictly honorable way, we shall do much to inculcate the same principle into the minds of our assistants; and if we use care and judgment in selecting the same, we shall accomplish much. To be a successful florist a young man should have a fair school education, and in addition he should have a natural taste and love for flowers. This combined with a good business training and strict application will produce the desired result in most instances. * * *

An establishment such as Mr. Hill advocated in his address to you last year would be of great help to the young student, but that would never make the successful florist alone. It is a deplorable fact that many who have graduated from similar institutions, although well versed in the theory of horticulture, are lamentably deficient in practical experience, and for some unaccountable reason, very few of them ever overcome the difficulty. There are some very honorable exceptions to this, but it's the exception, not the rule, so far as my observation has gone. * * * Theory is very pleasant to read, but if you wish to get at the root of a tree, you must take a spade and dig until you get it. And if you want to be a florist you must make up your mind to work hard, both with your hands and head. I do not by this wish to convey the idea that I am not in favor of a good training school, such as Mr. Hill advocated; on the contrary, I think it would be of great service to us. But there is another means by which we can all learn an immense amount of practical good, and that is by public exhibitions.

"These are not only educators of florists, but of the whole public at large, and as such we should do all we possibly can to advance and extend them; it may be they will not put money directly in our pockets, but they educate the public to love flowers and in the near future will bring its own reward. I would earnestly recommend this society to use its best endeavors to extend horticultural exhibi-

tions wherever possible, and also would suggest that the horticultural press of the country could do very much to stimulate and promote the same if more attention was paid to it. We as a body are very grateful to the same for the kindly way they have always treated us. And another of the important things we should encourage is new seedlings of home production. In our haste we do not give the time to this branch of the trade that we ought; though I am pleased to say we have several very promising things in this line raised here, and as our demand increases so will the desire to produce them without depending upon other countries for our novelties. Many of these we get from abroad are novelties only in name and not worth the paper it takes to describe them. This is particularly noticeable in many of the new roses sent to us from France of late years. Though there have been some grains among the chaff, very few indeed are suitable to our climate, and the sooner we turn our attention to this matter and go to work in earnest the better it will be for all concerned. A wide and interesting field opens itself for us, for although much has been done by men here to improve the carnation and some few other flowers with the best results, still a great many species have hardly been touched at all in the past, and to those we should now turn our attention and conduct it as we should our other business. This brings us to consider the method, or the lack of method, so general among us, in conducting our business. It is very much to be regretted that we should have to speak of this at all here, but with many of us who do a wholesale business, the fact is brought very plainly to our notice, and I think we, as a body, should take some means to protect the trade against those who buy goods, promising to pay at a certain time, and then after receiving the goods utterly ignore the fact that they owe anything to the party furnishing the same; and all such should be treated by this society as they deserve. There are many other loose practices in this business. For instance, having delivered goods to a man, the bill being due, we are very apt to get a reply to our request for payment of same, somewhat in this style: "I can not pay for the goods at present, as I have built another house since receiving the plants and it has taken all the money I had to do so." Such parties take it for granted they have a perfect right to use your money without even asking for the loan of it. Should you suggest they ought to pay interest for the use of your money, they would call you anything and everything except a fair dealing man. Yet in every business with which I am acquainted, except ours, any party allowing his bill to go unpaid over the date specified, expects to and does pay interest for all such time allowed, and no business can be expected to succeed where one party uses the capital of another without fair compensation. There are many other loose and irregular ways used by some in our calling, and all such abuses should be remedied by those who wish to be considered honorable men. The renaming of plants to suit the seller's purpose is, to say the least, a very objectionable practice, and it should be the business of this society to aid its committee on nomenclature all it possibly can, as the aim and object of the committee is to correct all such abuses. A flower needs only one name, and that should be its first, given to it by the raiser or introducer; and to any one buying an old variety at an advanced price, under a new

name, it is an injustice, and works against the best interests of the trade all over the country. * * * *

"In this and all other matters appertaining to our best interests, the various florist clubs and like organizations can be of great value to our profession in diffusing knowledge, if only treated in the right way; and we want also the co-operation of the retail florists for our interests in all matters are very closely allied, and I trust in the very near future we shall see them taking the same lively interest in our society as the growers now do, and we should use our best endeavors to protect the retail florist. From all over the country I have received letters complaining that the large wholesale growers are selling to private gentlemen at the same prices as to the retail dealers. This is undoubtedly a hardship, and to my mind an injustice and should, I think, have our careful consideration, and if possible a remedy should be found; for even where the dealer can buy at 25 or 30 per cent below the regular retail price, the heavy express charges he has to pay reduces his profits to a minimum.

"The Florists' Hail Association offers a good protection against its visitation and destructive work and deserves our earnest support. On the first of June last, Mr. Esler wrote me that there were over 1,200,000 feet insured, with a good reserve fund still on hand. This shows the thing has come to stay, and the increased interest on the part of the florists all over the country augurs well for its future prosperity. To those not already insured I would earnestly advise them to join it before the close of this convention, as the present time is everything to them."

Secretary Wm. J. Stewart's report showed that the past year had been a prosperous one for the society. He felt that the increase of the annual dues from \$2 to \$3 had proved a wise measure, as among the hundreds who had remitted their dues this year not one had criticised the change, and the number of members had not decreased.

Treasurer M. A. Hunt reported receipts for the year up to January 1 last of \$2018.23, and expenditures of \$1369.13, leaving 649.10 in the treasury, \$250 more than last year at same date. The expenditures since January 1 had been \$617.22, leaving a balance still in hand of \$31.88.

Mr. Peter Henderson as chairman of a committee, reported in regard to the duty on bulbs, recommending that an effort be made to have the present duty of 20 per cent abolished. A discussion which followed brought out the fact that tulip bulbs—which it has always been supposed could not be profitably grown in America—were being successfully grown in several states. The committee was continued and instructed to use their best efforts to have the duty abolished.

Mr. J. Horace McFarland submitted the report of the committee appointed last year to devise some plan whereby members might more readily become acquainted. It recommended the method now in use by the American Association of Nurserymen, which consists of a numbered badge and a "badge book" wherein is printed the name of the member opposite the number of his badge, arranged conveniently for reference. The report was accepted and the Executive Committee instructed to carry out the plan for the next convention.

Chairman J. D. Reynolds, of the committee on "Exaggeration of cuts in illustrated catalogues," recommended that catalogue men be invited to submit their illustrations to the Executive Committee

or a sub-committee with actual specimens of the object illustrated, and if found to be true to nature that a certificate to that effect be issued to him for use in his catalogue. He thought that in this way the honest man would receive an advantage which was due him. There was a lively discussion and the matter was finally referred to the Executive Committee with power to act upon the matter according to its best judgment.

Mr. W. C. Barry's essay on "Roses" was a very comprehensive and carefully prepared paper, and we shall probably give it in full in a later issue. In the discussion which followed Mr. Hill expressed the belief that in America the value of a new rose was too often decided by its adaptability for forcing. He thought that this was a mistake, as we needed roses for planting out as well as for forcing under glass. He related how the colors of old standard sorts of roses as seen growing in England varied from that of the same varieties when grown in America and attributed the marked difference to the effects of climate. While in England he had been favorably impressed with Brightness of Cheshunt and Ulrich Brunner.

In reply to the query as to what varieties of roses of recent introduction are specially useful to the florist, Mr. Hill mentioned Mme. Hoste and Duchess of Albany as promising sorts. He stated that the weak point of Mme. Hoste was its variable color, but that its freedom of bloom and sturdy growth would probably make it valuable. Duchess of Albany he considered an improved La France, a deeper pink in color and of stronger growth. He also expressed himself as very favorably impressed with Souvenir de Wootton. Regarding new varieties he hoped that American florists would raise their own and not be bothered with importing them. Then they could tie the plants and their sorrow into one bundle and bury them together.

Vice-President W. J. Palmer described a new method of keeping down the greenfly, which we shall illustrate and describe in an early issue.

In reply to the query as to whether Perles and other roses on Banksia and similar stocks were preferable to those on own roots Mr. Jas. D. Reynolds said he had most excellent results from Perles worked on the Banksia stock and considered it a grand good stock for the Perle.

Regarding the best way to raise fine mignonette in winter President May said that the main requisites to success were good soil, a dry atmosphere and common sense. He sowed seed from August 1 to October 1, or to have flowers by Christmas then before September 1. The seed was a select strain of Miles Hybrid Spiral and sown very thinly. The mignonette wants a deep cool bottom and he planted in solid beds. To produce large flower heads he disbudded all shoots below the flower spike. Should be grown cool.

Mr. A. Giddings in a written communication called attention to the value of the white aster as a winter flower. He believed that it would prove of considerable importance in helping out in winter when carnations were scarce. He had found that dwarf varieties took but little room. He had planted them among his roses near the glass and they had bloomed when only four inches high. He provided for a succession by replacing exhausted plants with others which had been held back for the purpose.

Boston, Mass., was selected as the city in which to hold the next convention and officers for the ensuing year were

A FLORAL CONCEIT; ARRANGED BY H. H. BATTLES

elected as follows: President, J. M. Jordan, St. Louis; Vice-President, M. H. Norton, Boston; Secretary, Wm. J. Stewart, Boston; Treasurer, M. A. Hunt, Terre Haute, Ind.

Mr. Robert Craig's essay on "The Elevation of Our Business" contained so much of general interest that we shall publish it entire in next issue, and Mr. Battles' essay on "Education" will be found in another column.

Mr. John Thorpe in a short paper told of the great value that a national experimental garden would be to the trade and the public at large and suggested his ideas as to the best manner of making an attempt to secure an adequate appropriation from Congress to carry out his plan. A committee was appointed to follow up Mr. Thorpe's suggestions.

Mr. J. C. Vaughan believed that while the practice of advancing the prices of cut flowers on special occasions was undoubtedly detrimental to the best interests of the trade, it was necessary to offset losses to growers during times of surplus, and such fluctuations would always exist. Mr. John Westcott considered 100 per cent over cost of the flowers as a proper price for the retailer to ask. This could not be made an iron clad rule and certainly not at the holidays, but it should average about that in order to make a profit after waste had been deducted.

Mr. Jas. D. Reynolds thought that the one word "Co-operation" answered the query as to how the local Florists' Clubs and the National Society could work together to promote their common interests. He presented a plan whereby the local clubs could give exhibitions under the guidance of the National Society and believed that co-operation in this way would accomplish a very desirable result.

Mr. Wm. Scott was convinced that the general florist in small cities and towns would find it to his advantage to add the

sale of hardy plants and shrubs to his business, but that in large cities where the business was largely divided into specialties it would not be so advantageous. "Can the society do anything to regulate the prices of bedding plants throughout the country?" was a query to which Mr. Peter Henderson replied with the one word, "No." Mr. J. D. Carmody described a method of killing grubs in the soil by heating the soil before placing in the benches. At first thought this seemed a tremendous job where a large quantity was used, but in discussion it was brought out that it could be done with great rapidity by piling the soil on steam pipes arranged for the purpose. Many who were at first incredulous finally expressed the belief that the plan was feasible. Mr. Charles Anderson had found no effective cure for the black spot on roses.

Mr. Edwin Lonsdale in his essay on horticultural exhibitions told of an exhibition at Germantown, near Philadelphia, at which competition was confined to amateurs—mostly people of very moderate means—among whom plants and seeds had been previously distributed, all plants and flowers exhibited being grown from them. He believed that great good had been accomplished in this way and recommended that the same plan be adopted in other cities. He thought that the daily press should devote more space to describing exhibitions, and in the discussion which followed it was held by several that managers of exhibitions should be careful to have some competent and impartial person devote his whole time to giving proper information to press representatives during the exhibition.

The essay on "Useful summer blooming flowers" by A. E. Whittle, will probably appear in full in these columns at an early date. Mr. J. M. Jordan

called attention to the fact that the season of blooming of many summer flowers could be prolonged by being careful to pick off all blooms whether needed or not, and thus prevent the plant from exhausting itself by perfecting seeds. In the case of dahlias he recommended that the points be nipped out, inducing free branching.

The committee on dishonest dealers reported a plan which after two sessions of discussion was adopted. The details will be found in another column.

The essay on Landscape Gardening by Wm. McMillan, superintendent of the Buffalo parks, was a most telling satire on the present craze for the artificial and abnormal in gardening. The following paragraph was received with long continued applause and laughter:

"The absurdity of the leading motive in carpet bedding may be found in listening to the kind of talk we often hear from ardent enthusiasts of the practice. A shallow amateur in such work who has not before seen the highest art in this line visits some notable display on some private estate or public park, and on his return regales his gaping friends with some such description as this: 'You can form no idea of the immense quantity of plants in such a garden. A 10-acre lot would be well filled if all were put together. The edging and ribbons if strung out on end would measure over a mile. They were of nearly every imaginable color you can find in the stores. The ring-streaked, speckled and spotted plants and those with all shades of bronze and gold were legion. They were set out with the most wonderful ingenuity into so many patterns that carpet bedding was no name for it. There were Turkish rugs, church windows, wheels within wheels, figures of animals, statuary, hieroglyphic writing, plain print, and emblematic symbols of all kinds in geometry and

astronomy! The first thing that struck my eye was a bright bed of fire red coleus, a circular mound, raised high up in the form of a half globe. That was a sunset when there is a thick haze on the horizon. Near by was a crescent in variegated alyssum. That was the silver moon. I could not tell whether she was in her last quarter or the first. The horns pointed to the north and were equally correct for either phase. Next came a circular bed that seemed a combination of both the others. One disk in very dark leaves overlapped a whitish crescent about two thirds. This was an eclipse. I could not at first tell whether it was the sun or the moon that was eclipsed. After a little study I got on to the gardener's trick. It was either or both, according to your pleasure or fancy. All around were lots of little stars and one or two small disks curiously belted and girded. Having seen pictures of the telescopic appearance of Jupiter and Saturn I at once divined the meaning. There was any number of figures of men and beasts and birds and fishes. A military officer in full uniform was very imposing. A prize fight in full tilt, and base ball players with clubs drawn looked dangerous. A boat race with four rowers pulling the oars was quite exciting. In statuary the finest design I saw was a copy of St. George killing the dragon. It was full of spirit and action. A little puff of wind now and again crossing the dragon's head made his jaws seem to open and shut quickly. The feathery stuff used for the tail of the steed actually whisked gently in the breeze. The brightest spot of all had a display of flags of all the leading nations. The tricolor, the Union Jack, and even the stars and stripes were easily imitated, but some of the others tried the highest art of the gardener. In the geometry section I was for a long while puzzled by a most intricate figure, the meaning of which I could not make out. At last I detected the faint outline of an arch spanning the whole. That gave me the cue. It was the tough problem in Euclid called the Asses' bridge. I remember how it puzzled me when at school, and it is equally hard to see through it in a flower bed."

He closed with a discussion of what is beautiful in floral decoration, in which he gave wide latitude to beauty as it appealed to the varied tastes of different individuals.

THE FESTIVITIES.

On Friday morning by 9 o'clock the convention was on its way to Niagara Falls on the special train arranged for by the Buffalo club and the sights of this famous resort were enjoyed until 1:30 p. m., when the train returned to Buffalo and by 2:30 the excursionists were on their way to Music Hall on street cars which met them at the depot.

In the great hall six long tables had been arranged with a cross table at one end at which sat those who were expected to say something wise and witty later on. Fully 600 people were quickly and comfortably seated and the good things rapidly disappeared for appetites were sharpened by exercise.

Mr. Wm. Scott presided as toastmaster. The first toast was to the Society of American Florists, which was responded to by President John N. May, who said that the National Society had met with kindly receptions in other cities, but no city had ever shown to its guests better hospitality than on this occasion. He then proposed "The City of Buffalo,"

which was responded to by Gen. John C. Graves.

"Our hosts—the Buffalo Florists' Club" was proposed by President-elect J. M. Jordan and responded to by Wm. Scott, and led by Chas. Anderson, of New York, the convention gave three ringing cheers for the Buffalo club.

"Our Guests, the S. A. F.," was responded to by L. H. Foster; "The officers of the S. A. F.," by E. G. Hill; "The officers of the Buffalo Florists Club" by Wm. Scott on behalf of Dan'l B. Long; "Kindred Societies" by Jno. F. Cowell; "The Florists' Clubs of America" by Robert Craig; "The Horticultural Press" by Elias A. Long; "The ladies of the S. A. F.," by J. M. Jordan; "The Executive Committee" by A. P. Calder; "Novelties" by John Thorpe; "The past, present and future of the S. A. F.," by Wm. J. Stewart.

After the speechmaking was concluded the waiting carriages were soon filled and the drive through the avenues and parks of Buffalo was begun. It was dark when the loads of tired but thoroughly pleased florists returned from their ride and all voted the day one of the most enjoyable ones they had ever known.

NOTES.

Fully 500 were in attendance.

The excursion to Niagara Falls was well conducted and all were greatly pleased.

The change from three to two sessions daily was commended by all as a wise move.

The portraits(?) which appeared in the local papers were enough to make the angels weep.

The Hub's invitation was extended with a hearty unanimity, which augurs well for 1890.

Won't there be a crowd at Boston next year? But Horticultural Hall will hold all that come.

Where will the objector to the entertainment feature now find a place to hide his head?

The Buffalo Club is to be commended for the tasteful plant decoration in the convention hall.

The S. A. F. has not reached the zenith of its fame and usefulness. It is still on the upward move.

The Buffalo Florists' Club has covered itself with glory. The dissatisfied visitor could not be found.

The Buffalo people must have had an understanding with the weather clerk. It could not have been more pleasant.

Retiring President J. N. May was presented with a handsome and valuable microscope by Mr. E. G. Hill on behalf of the convention.

As Mr. Robert Craig said: "Great Scott, what a base ball game we did have!" The score was 33 to 11 in favor of the Buffalo team.

Dan'l B. Long of the local committee didn't talk much (except when making announcements), but worked hard and accomplished wonders.

The collation at the Music Hall and the carriage drive through the city afterward were greatly enjoyed. The speeches at the Music Hall were happy and pointed.

There are great possibilities before the Buffalo Club. If they can do so magnificently when young and inexperienced what may we expect at some future time.

In the Bowling Tournament the scores were as follows: New York 737—Buffalo 728; Boston 576—Philadelphia 571; Buffalo 676—Boston 630; New York 760—Boston 697.

Mr. Robert Craig, chairman of the "National Flower" committee reported that the committee considered it inexpedient to name any particular flower at this time.

The thanks of the convention were extended by resolution to the officers, the executive committee, the Buffalo Florists' Club, the Mayor of Buffalo, the essayists and the Buffalo press.

The work of the "Standard Pot" committee was indorsed and it was decided to give a certificate of merit next year to the potter who most nearly conforms to the standard adopted by the society.

The exhibition was certainly of great excellence. The United States Nurseries' show of orchids was undoubtedly the best representative collection ever shown at this time of the year. The exhibits of plants and cut flowers made by Henry A. Dreer and James Vick were also worthy of special commendation. We shall make more extended notes on other pleasing features in future issues.

The National Chrysanthemum Society was organized with officers as follows: President, John Thorpe, Pearl River, N. Y.; Vice-President, Wm. K. Harris, Philadelphia; Secretary, Edwin Lonsdale, Chestnut Hill, Philadelphia; Treasurer, John Lane, Chicago, and an executive committee of nine. The annual dues were fixed at \$2. Those desiring to join may secure full particulars by addressing the secretary.

The \$100 prize offered by Mr. Peter Henderson for the best herbarium of native plants was awarded to G. W. Oliver, Washington, D. C., and so excellent was the second best one that Mr. Henderson generously gave it a second prize of \$50, this going to Mr. J. H. Butterfoss, Lambertville, N. J. The herbariums entered by J. H. Brummel, Carroll Station, Md., and J. Gilchrist, West Toronto Junction, Ont., were also highly praised.

LIST OF EXHIBITS.

L. B. Brague, Hinsdale, Mass.—Ferns, bouquet green, Christmas trees and sphagnum.

Benj. Grey, Malden, Mass.—cut blooms of water lilies, including *Nymphaea Zanzibarensis*, *N. odorata rosea* and *N. Devonensis*.

F. M. Hine, Buffalo—Cut blooms of pansies of excellent colors, form and substance. Received honorable mention by committee.

Peter Henderson & Co., New York—Bulbs of Liliun Harrisii.

United States Nurseries, Short Hills, N. J.—A most excellent display of orchids and decorative plants and cut blooms of hardy plants. Worthy of much more extended notice.

Fred Creighton, New Hamburg, N. Y.—Seedling carnation, pink in color and plants of good habit.

Bunker & Co., Boston—Wheat sheaves. J. R. Wotherspoon, Philadelphia—Watering pots and fumigators.

Whilldin Pottery Co., Philadelphia—A large exhibit of standard pots of all sizes and excellent quality of ware.

Sipfle Perkins & Co., Syracuse, N. Y.—Standard pots in all sizes and of good quality.

Detroit Flower Pot Manufactory—Standard pots in all sizes. Honorable mention was given for their decorated chrysanthemum pot.

D. C. Schofield, New Brighton, Pa.—Standard pots and terra cotta vases.

Milsom Fertilizer Co., East Buffalo, N. Y.—Bone fertilizers.

W. P. Simmons & Co., Geneva, O.—Cut blooms of newly imported geraniums, each one plainly labeled. A style of exhibit which should be encouraged.

ALYSSUM SAXATILE.

A. J. Binley, Glens Falls, N. Y.—Pot washing machine.

Jno. L. Diez & Co., Chicago—Sash bars, gutters, etc.

Smith & Smith, Kenton, O.—Mailing boxes.

W. C. Krick, Brooklyn, N. Y.—Immortelle letters, inscriptions, etc.

J. A. Penman, New York—The Dictionary of Gardening.

J. Horace McFarland, Harrisburg, Pa.—Specimens of printing for florists.

R. F. Lawrence & Co., Buffalo—Dress bouquet holder.

J. M. Gasser, Cleveland, O.—Glazing joints.

C. S. Ford, Jr., Philadelphia—Immortelle letters, inscriptions, etc.

Wm. H. Koehler, Philadelphia—Stuffed white doves, including several novelties in sizes and positions.

N. Steffens, New York—Wire work for florists.

Wilhelmi Mfg. Co., New York—Baskets, etc.

M. M. Bayersdorfer & Co., Philadelphia—Baskets and florists' supplies. Received first class certificate.

F. E. McAllister, New York—Bulbs and florists' requisites.

Philadelphia Immortelle Design Co., Philadelphia—Immortelle designs, letters and wheat sheaves.

B. A. Elliott Co., Pittsburg—Tuberous begonia plants and cut blooms.

Craig & Bro., Philadelphia—Palma and ferns.

J. C. Vaughan, Chicago—Bulbs, florists' supplies, tools etc.

Osman & Co., London, England—Tools and supplies.

C. H. Joosten, New York—Imported plants, including palms and azaleas.

Jno. F. Cowell, Buffalo—Blossoms of hybrid tropaeolums.

Henry A. Dreer, Philadelphia—Palms and other decorative plants, cut flowers of dwarf French cannas and gloxinias. A most creditable exhibit.

James Vick, Rochester, N. Y.—A large exhibit of cut gladioluses for which a first class certificate was awarded. Also an excellent collection of blossoms of asters, dahlias and phloxes.

Dan'l B. Long, Buffalo—Photographs of floral designs.

Wm. K. Harris, Philadelphia—Palms and like decorative plants.

C. Thurston, Ridgewood, N. J.—New begonia, a cross between B. Sanguinea and B. metallica.

Lockland Lumber Co., Lockland, O.—Sash bars, gutters, etc.

J. C. Jewett Mfg. Co., Buffalo—Refrigerator.

H. S. Miller & Co., Newark, N. J.—Bone fertilizers in various forms for florists' use.

Quaker City Machine Works, Richmond, Ind.—The Evans Challenge ventilating apparatus.

E. Hippard, Youngstown, O.—Ventilating apparatus which received a first class certificate of merit.

Hitchings & Co., New York—Hot water boilers and ventilating apparatus.

Eureka Steam Heating Co., Rochester, N. Y.—Steam heater.

D. E. Howatt, Hyde Park, N. Y.—The "Acme" water heaters.

Herendeen Mfg. Co., Geneva, N. Y.—The "Furman" steam heater in several sizes.

Richardson & Boynton, New York—The "Perfect" water heater.

John A. Scollay, Brooklyn, N. Y.—The "Scollay" boiler.

The Birdsall Co., Auburn, N. Y.—The "Steel and Coil" boiler.

Nelson & Forsyth, Berlin, Ont.—The "Renwick" boiler.

Alyssum Saxatile.

When Mr. Whittle was here last May he noticed a little plant of this, the golden alyssum, in bloom, and was much

pleased with it, and it occurred to him that if he could get up a stock of it in pots and have it in bloom at Easter, it "would sell like hot cakes." This is all very well about the little plant which he saw and which had come up as a weed by the edge of a bed of paeonies, but what would he have thought of such a specimen as the one represented in the accompanying illustration, had he seen it in its glory—two weeks before he was here?

This is one plant, two years old from seed, and a dense mat three feet square, and when in bloom was a solid mass of bright golden-yellow, fragrant flowers. The illustration is from a photograph by Sandman, taken second week in May.

Now this plant is "as old as the hills," hardy as a dandelion, evergreen, always of dense, compact form, extremely floriferous, and it blooms from April into May. And as it is one of our earliest spring flowers it needs very little forcing to have it in bloom at any time in late winter or spring. And one good thing about it is, that when in bloom, it can be packed easily without injuring its flowers. One year old plants make excellent blooming stock. I usually sow in March or April for flowers the next spring. In light land and an open sunny situation, it makes a good perennial; in heavy land I have found it most satisfactory when treated as a biennial.

Although the common form is excellent, I prefer the more compact one and select and save my own seed, for not only do the plants vary a little in evenness but also in the brightness of their colors. Still all are good.

Glen Cove, N. Y.

W. F.

The Florists' Protective Association.

The first steps taken in this direction resulting in the organization now effected was in the form of a resolution offered by Mr. J. D. Carmody, of Evansville, Ind., and adopted by the society at New York as follows:

"Resolved: That a committee of five shall be appointed who shall prepare a plan whereby members of this society may be protected from the evil designs of dishonest and irresponsible dealers who, by obtaining goods without paying for them, undersell their honest competitors, thereby injuring the trade at large as well as those from whom their goods are obtained."

The committee appointed in pursuance of resolution consisted of Messrs. Vaughan Craig, Hunt, Carmody and Halliday. Following the committee's report a favorable desire for organization was shown and the committee instructed to prepare constitution and by-laws. These when reported were thought too cumbersome and after free discussion and adjournment a revised plan was presented, which after very short discussion was adopted; officers were elected and fifty members joined. Mr. H. B. Beatty, of Oil City, Pa., was elected secretary and treasurer, and Robert Craig, J. C. Vaughan and Peter Henderson chosen members of the advisory board. General features of the plan are: Reports quarterly, or as often as occasion requires. Affidavits must be affixed to all lists sent in. Rehearing can be had by any one who thinks himself unjustly reported. This plan which in the judgment of some of the oldest members of the S. A. F., is the most valuable feature of the society's work this year, can be had from Secretary Beatty by remitting the \$2 fee entitling to all reports.

Education.

BY H. H. BATTLES.

[Read before the Society of American Florists at Buffalo, August 21.]

In offering this essay I must ask the indulgence of the older and wiser members of this society. If I can so stimulate some of the young members that they may realize the importance of self culture and of training their faculties in the proper channels, that they may lead more useful and happier lives, I shall consider myself most fortunate.

It has been said that "Instruction and breeding are to education as parts to a whole. Instruction respects the communication of knowledge, and breeding respects the manners or outward conduct, but education comprehends not only both of these, but the formation of the mind, the regulation of the heart and the establishment of the principles. Good instruction makes one wiser; good breeding makes one more polished and agreeable; good education makes one really good. Want of education will always be the injury, if not the ruin of the sufferer. A want of instruction is of more or less inconvenience, according to circumstances; a want of breeding only unfits a man for the society of the cultivated. Education belongs to the period of childhood and youth; instruction may be given at different ages; good breeding is best learned in the early part of life."

I think that it was Oliver Wendell Holmes who, when asked the best time to commence to educate a child, very aptly replied, "one hundred years before it is born." Unfortunately some of our ancestors did not appreciate this fact, and because of their oversight we see constantly around us, and even in our business men who seem to work by instinct, knowing that they are obliged to work to live—plod, plod, all their lives.

It is often the case that these same men are the first to express positive opinions; there is apparently no subject too abstruse for them; questions that have been unanswered for centuries they will settle to their own satisfaction with a few words. Happy is the man who can some day wake up to the fact that he has a great deal to learn; that he really does not know it all; and in fact realizes that he knows very little. Then is the time, even if his education did not commence one hundred years ago, that there is hope for him. He feels like a different person, his imagination is excited, his whole being stimulated, and he is anxious to know something of this wonderful world on which he finds himself, and of the brilliant men that have lived before him. For this knowledge, in all meekness he goes to books, and what a new world they open to him—he is surprised that this or that author had the same thoughts that have gone through his clouded mind, with him they have been for years nothing but seeds, yet how naturally they have developed into fruit under the treatment of an educated mind.

There is no class of men who realize more fully what cultivation will do for the vegetable kingdom than we florists. Let us then devote more time to cultivating our minds, that we may get more good out of life; and when old age does overtake us (having health) we can enjoy that repose which is sure to come with an educated mind.

To lead successful lives we must discipline our minds and bodies. Health is the first thing to be considered; without it we are a burden to ourselves, and a source of anxiety to our friends; with it

we can carry our friend's burdens, our minds being clear and active stimulates us in the exercise of our daily duties, with strong healthy bodies we can do more and better work.

Harper Bros., of New York, publish two excellent books on the subject, by Wm. Blaikie, "How to get strong," and "Sound bodies for our boys and girls." In the preface of one he says: "Millions of our people pass their lives in cities and towns and at work which keeps them indoors all day. Many hours are devoted for days and years under careful teachers and many millions of dollars are spent annually in educating the mind and the moral nature; but the body is allowed to grow up all uneducated; indeed, often such a weak, shaky affair that it gets easily out of order, especially in middle and later life, and its owner is wholly unequal to tasks which would have proved easy to him had he given it even a tithe of the education bestowed so generously in other directions. Not a few, to be sure, have the advantage in youth, of years of active outdoor life on a farm, and so lay up a vigor which stands them in good stead throughout a life time. But many, and especially those born and reared in towns and cities, have had no such training, or any equivalent, and so never have the developed lungs and muscles, the strong heart and vigorous digestion—in short, the improved tone and strength in all their vital organs which any sensible plan of body culture followed up daily would have secured. It does not matter so much whether we get vigor on the farm, the deck, the tow-path, or in the gymnasium, if we only get it. Fortunately, if not gotten in youth when we are plastic and easily shaped, it may still be had, even far on in middle life by judicious and systematic exercise, aimed first to bring up the weak and unused parts, and then by general work daily which shall maintain the equal development of the whole."

Secondly, we should cultivate the faculties which secure the necessities of life, the faculties that make us useful in our business. Much could be said on the subject of choosing our occupation in life. Too often it is done carelessly—many a good blacksmith has been spoiled by making him a poor doctor, simply because of a lack of judgment. How carefully the boy's character should be studied before deciding what occupation he should follow; once chosen his energies should be directed in that channel, study every means to perfect him in that branch, and with health and constant application success will follow.

No amount of book learning will excuse a man for not being self supporting. If he consumes and does not produce he is to society what black spot is to our roses. Having health and means to maintain a home, his next duty is to study how to educate his children. Too often parents are so wrapped up in their business and selfish desires that their children pick up what knowledge they can—in school and on the street—and when the child grows up they are surprised that he is so anxious to leave home, and that he has developed this taste, or that taste; not realizing that it was in their power to a very great extent to guide that child's life in the proper channel.

Dickens gives us an excellent example of misapplied energy in the character of Mrs. Jellyby, a woman who devotes all her time to the inhabitants of Borrioboola-Gha, at the expense of her own family. Another story of Dickens' that I have lately re-read with pleasure, and I hope

profit, is "Hard Times," a powerful lesson in life.

Thirdly, social and political relations demand our attention. Our lives depend, to such a great extent, upon those with whom we associate, that our friends should be most carefully chosen. The word "Friendship" is so often abused that it is well to realize its full meaning. The knowledge and fulfillment of political duties teaches us to be good citizens.

After giving our attention to health, business, family, society and politics, we should devote our attention to recreation, the gratification of our tastes and desires. It is well "to know how wisely to lose time." In separating these duties it must be borne in mind that they are but links to a chain, all depending on each other, and all necessary to a happy and successful life. Health, or self-preservation, naturally considered first, as it is necessary to have this that we may fulfill our other duties. Then again, we must have means by which we can live and support our family and become good citizens. All men, with but few exceptions, are employed in producing, preparing and distributing commodities; and it is for the purpose of studying the best methods of producing, preparing and distributing seeds, plants and flowers that these conventions are held.

I will not take time to discuss business methods here. The Executive Committee have presented so many practical questions and such able men will answer them, that what I could say would be superfluous. I am glad to note an awakening interest in the question of color. Knowledge on this subject is absolutely necessary to the successful arrangement of plants and flowers. I note also that the landscape gardener is devoting less time to constructing poorly shaped animals out of plants, and the retail florist is making fewer doves out of flowers, which shows progress in these two branches.

The Florists Clubs, as auxiliaries to the National Convention, are doing much good, but are capable of much more. I would earnestly advise the members of such clubs to establish libraries, using the greatest care in selecting the proper literature, subscribing for the best trade papers, for the monthly magazines, a class of literature that has greatly improved in the last few years. If daily papers are put on the club tables let them be the best, those that contain the shortest account of crime and the least amount of scandal. Our faith in human nature is none too strong, that we can afford to have it constantly lessened by reading the minutest details of the vilest crimes.

Petrarch, in speaking of books, said: "I have friends whose society is extremely agreeable to me. They are of all ages and of every country. They have distinguished themselves both in the cabinet and in the field and obtained high honors in their knowledge of the sciences. It is easy to gain access to them for they are always at my service, and I admit them to my company and dismiss them from it whenever I please. They are never troublesome, but immediately answer every question I put to them." "Some relate to me the events of past ages, while others reveal to me the secrets of nature; some teach me how to live, others how to die. Some by their vivacity drive away my cares and exhilarate my spirits, while others give fortitude to my mind, and teach me the important lesson how to restrain my desires and depend wholly on myself. They open to me, in short, the various

PHORMIUM TENAX VEITCHIANUM.

avenues of all the arts and sciences and upon their information I safely rely in all emergencies. In return for these services they only ask me to accommodate them with a convenient chamber in some corner of my humble habitation, where they may repose in peace, for these friends are more delighted by tranquility of retirement than with the tumult of society."

This, gentlemen, was said over five hundred years ago; think for a moment of the knowledge that has accumulated since then, how many generations of men have lived and laid their products of their labor at our feet. Lord Macaulay in 1825 said: "Any intelligent man may now, by resolutely applying himself for a few years to mathematics, learn more than the great Newton knew after half a century of study and meditation." Do we realize our advantages and make the best of our opportunities?

I wish, gentlemen, that this convention could in some way stimulate the Florists' Clubs, that they might add a library to their possessions. The knowledge that individuals would gain through this medium would reflect credit on the whole trade. How interesting it would be to note what different clubs would select; what a source of profitable conversation is offered when your friends have read

this book, or that book, in which you have been interested. I trust that some gentleman with more ability and power than I possess will say something on this subject that will lead the clubs to think well of these suggestions, that in an early number of the AMERICAN FLORIST we may see an account of the first club to start a library. Which city shall it be?

Phormium Tenax Veitchianum.

Our illustration is from a photograph sent us by Mr. M. Lafferty, gardener for the Laurel Hill Cemetery, Philadelphia, who writes under date of July 16:

"We mail you with this a photograph of a plant of *Phormium tenax Veitchianum* now in bloom here and which will evidently bear seed. We have never seen this variety in bloom before and would like to know if any of your readers have. The plant photographed is growing in a cedar tub 16x20 inches and has sent up three flower stems to a height of nine feet. On these stems are numerous florets, something on the canna order, but much smaller. The seed pods are of the pea shape, each pod containing three seeds.

"We consider the plant useful for ornamental work, and believe that if better known it would fill a space now occupied

by less worthy stuff. We have counted over 200 leaves on the plant at one time from one to six feet in length, every leaf with its outside band of white. The young shoots remind one of a beautiful sunrise. Plants of this variety grown in 6-inch pots make excellent center plants for large vases, standing all kinds of weather."

The plant is undoubtedly valuable as a fine foliage plant. It is slow to propagate but it can be gotten up as quick as aralias and a good many other choice plants, and it only needs cool treatment.

Gladioluses.

Every florist who has ground to spare should grow gladioluses in summer. They are an accommodating and profitable crop and easy to grow and they seem to thrive better in America than anywhere else on the face of the earth. During the winter months when our attention is occupied with greenhouse forcing, our gladioluses are stored in shallow boxes, dry and free from frost in the shed, and the boxes piled one above the other ceiling high and with openings between them for ventilation.

In late winter or early spring as the carnations, heliotropes or other winter bloomers fail and are cleared out we may fill the benches with gladioluses for Easter or other spring trade. Forcing gladioluses is now becoming quite a feature, and as the bulbs are cheap or easily gotten up and we use them as a second crop, the thing is worth considering.

As the spring advances and there is a let up on greenhouse work and a falling off in the supply or demand for flowers, we can find time to plant out our gladioluses for stock. This is usually done—bulblets about the end of April, and mature bulbs between the first of May and the first of June, as time permits, but preferably as early as possible, and always in rows. There is nothing delicate about them, that is, in their constitution, and they are seldom troubled by insect or fungoid pests. And a vast multitude of them can be grown in a small space, and we cultivate them in summer with horse power just as if they were mangolds or cabbages. We ignore European methods of cultivation—we don't plant each bulb singly, head up and a few inches distant from its neighbor, but we open the rows and sow the bulbs thickly in them as if we were sowing beans or peas and with no care whatever of how they lie in the row, and they grow up superbly. The earlier one plants the larger and better matured bulbs he is likely to have, anyhow he will have more, larger and better matured bulblets for increase of stock.

But the florist who is interested in cut flowers should make several plantings, say at intervals of a fortnight, and between the end of April and the 10th of July. This should give him a regular succession of flower spikes between early in July and the end of September or later if frost permits. Planting later than the 10th of July has been uncertain with me, except *Brenchleyensis* few kinds have matured their spikes very well when planted so late.

Gladioluses are increased from seed, multiplication of bulbs, division (seldom practiced here), and bulblets. Seeds germinate as freely as do those of onions, and some of the seedlings show bloom at two years old, but most of them not till three years old. From seed we don't know what we get till we see the blooms, and then many of them are sure to be commonplace. From bulblets we get the

exact counterpart of the parent. In the matter of cultivation we usually treat them as if they were one year old seedlings.

Some varieties require good care and good cultivation in order to succeed well with them, and others again, reds especially, grow strongly and multiply exceedingly with very little care. And this is a good deal the reason why, in the case of mixed gladioluses, the reds after a few years seem to predominate, they have merely outmultiplied and outgrown the paler colors. This is very well understood by growers, and they make a point of thinning out many of the reds every year to maintain a well balanced mixture.

As the farmer grows potatoes for home use and market so should the florist grow gladioluses; he should grow all he wants for his own use in forcing, abundance for summer flowers and a surplus to sell. The summer stock affords him material for summer flowers, and as it is better for the bulbs that the flower spikes should be cut off than retained, we find a double gain in improving the bulbs and having flowers to sell.

Specialists in the cultivation of gladioluses are obliged to grow a very large assortment of named kinds in order to hold their trade with the dealers, and some of these kinds are worth a dollar a bulb. But this sort of business won't pay the ordinary florist, he should restrict himself to a few staple varieties, sorts that are ever in demand and of which he can not raise too many. No matter if they are cheap, if you have good bulbs and lots of them you can sell them.

The ordinary type of gladiolus consists of varieties of what are known as Gandavensis. At present there is not among them a good white or good yellow flowered gladiolus in the trade. Hallock's Snow White is by far the best white that has been noticed, but it is not yet upon the market.

Among the best kinds for a beginner to grow are Shakespeare and La Candeur, whitish, and Isaac Buchanan, yellowish; Brencleyensis and Meyerbeer, scarlet; Phœbus, bright red with white throat; Madame Moneret, delicate pink, and Eugene Scribe, rose and carmine.

For early work, and especially to come in early on a warm spot outside, try Shakespeare, white, and Romulus, brilliant dark red. In fact if they start a little before being set out, as they are apt to do, it won't hurt them any. And if you can afford to get two varieties to hold on to to get up a big stock of try Flamboyant and Le Vesuve, brilliant scarlet and superb.

And further, among pale colored varieties I would recommend Angele, Ceres, John Bull, Norma, Ondine, Reine Blanche and Sylphide, and among the best of the reds Africaine, Cameleon, Couquète, Hesperide, Leander, Mount Etus and Napoleon III.

"Lemoine's Hybrids" are a race of gladioluses that was obtained by M. Victor Lemoine, of France, by crossing Gladiolus purpureo-auratus with G. Gandavensis. Some of these hybrids are very beautiful. The attempt is made to secure brilliancy of color and at the same time retain the characteristic form of purpureo-auratus, for there is quite an inclination among seedlings to partake strongly of the Gandavensis form. The flowers are small, sometimes campanulate, and frequently hooded, but their most positive character is the rich crimson-purple blotch on the two, or often three, lower segments. The plants are vigorous and healthy, but somewhat slender; the flower spikes are moderately long, but often slender, and the blossoms

are more remotely placed in the spikes than is usual in Gandavensis, or crowded near the end of the spike.

These hybrids have the reputation of being hardy, but they are not. Simply because we meet occasional instances where they may have survived the winter is no proof at all of their hardiness. In cultivating them plant them out early in the season and let them stay in the ground late. In fall they seem to be ripe long before they really are fit to dig. Our object is to get the little bulblets well ripened, for unlike the bulbets of most other species that nestle close to the base of the large bulb, these shoot off a little ways and seem to be softer than other bulbets, and they are more difficult to keep over winter.

Their intense colors, dark purple, crimson and gold, may appeal strongly in favor of them as cut flowers; at the same time there is a lot of lilacs, purples, dirty yellows and dirty whitish colors among them that can not find popular favor. And they have another fault, buds don't open well in water. I am informed that Lemoine has now got something extraordinary in this line in the way of brilliant colors, and even a blue one!

The following are, I think, the best we have in quantity: Gambetta, crimson purple; Enfant de Nancy, orange red and crimson, with intensely dark blotches; Sphinx, warm orange, very dark blotches, and M. Henry (Scarlet Lizard), orange scarlet with belts of bright gold along its blotches. Etoile is a fair yellow, as yellows go, and Talma, a lilac-pink, and Marie Lemoine, yellowish and bluish, is about as good as any of its class. There is no good white.

The Max Leichtlin Hybrids. Now let me whet your appetite and make your mouth water, for the grapes are very sour and shall remain sour for a year or two longer, that is, these hybrids won't be sent out before then. You might have noticed a few of them stuck in among the Gandavensis flowers at Peter Henderson's show, but not a word anywhere to indicate what they were. Now let me give you an expert's (C. L. Allen) opinion about these. He wrote in a periodical in 1885: "At Hallock & Thorpe's * * * They have also a new class of seedlings which originated with Max Leichtlin, of Germany, which for size and shape of flowers, together with length of spike, have no equals. * * * When the time comes (when it will be offered for sale) the lovers of the gladiolus may expect such a treat as their eyes have never feasted upon."

These hybrids are a cross between Gladiolus Saundersii and G. Gandavensis, and were raised several years ago by Max Leichtlin, of Baden-Baden, Germany. He disposed of his complete stock to a French firm, who in turn disposed of it to the Hallocks. Gladiolus Saundersii is one of the hardiest of all gladioluses, and has elegant, showy scarlet flowers mottled or suffused with white on the lower segments. In the hybrids most all the pink, orange, scarlet and crimson colors peculiar to Gandavensis, may be found, but the endeavor is to preserve the form of Saundersii and its white markings. And a curious fact about these hybrids is that they supersede immensely either of their parents in vigor of growth, length of spike and size of blossoms. I have measured lots of them 6 feet high, and splendid at that, and whose flowers without being spread artificially, measures $5\frac{1}{2}$ inches across, and when spread out flat by hand 7 inches across.

WM. FALCONER.

Glen Cove, N. Y.

Arboretum Notes.

v.

Scarcely less effective than when in bloom and equally interesting are the shrubs in fruit. The *loniceras*, for example, make a grand show. No flowering plant can be handsomer than one of these shrubs covered with fruit. Among the best is *L. Ruprechtiana*, a variety with narrow foliage and now loaded with bright scarlet berries. *L. Morrowii* is another pretty variety bearing berries of a deeper shade than the former, the color approaching crimson. *L. Tartarica*, the well known Tartarian honeysuckle, is seen in many varieties, with fruit either red or yellow. *L. Xylosteum* has very large berries, but not quite so showy, the fruit being very dark red.

One of the most beautiful midsummer fruiting shrubs is *Sambucus racemosa*. The fruit is in large panicles similar to the well known elderberry, but is bright coral scarlet in color. No more effective object on the lawn can be imagined than one of these small trees loaded with fruit. The fruit ripens early in July and remains perfect for several weeks.

For rock work and similar situations when a low creeping plant is required *Vaccinium Vitis Idæa* is well adapted. It forms a low close evergreen carpet and bears large quantities of scarlet berries resembling small cranberries.

Cotoneaster vulgaris is another very decorative shrub when in fruit. The berries are scarlet and remain from midsummer till late fall. It grows to a height of from three to five feet.

Rhamnus frangula is in fruit and flower at the same time. The berries are seen in all stages, green, red and black; eight to ten feet in height.

The Ribes or currant family is well represented by some exceedingly ornamental species. One of the best is *R. alpina*. The foliage is dark glossy green and the fruit is bright red borne in large quantities close to the branch. *R. saxatile* has berries egg shaped and orange scarlet in color.

WM. J. STEWART.

Boston, August 1.

Older Varieties of Bedding Geraniums.

Sparkler is a scarlet bedding geranium of English origin introduced over twenty years ago and at that time commanding a higher figure than geraniums (pelargoniums) are usually sold for, even the most promising new varieties not excepted. It is a most intense color, belonging to the nose-gay section, dwarf compact habit with soft, dark green leaves without zone. It is a most abundant bloomer with immense trusses well filled and lasting, and with me has proved the best scarlet bedding geranium of any I have ever tested.

Gen. Sherman is another of the older varieties par excellence, also belonging to the nose gay section, with large florid and trusses of a light crimson shade, certainly a most distinct color. The ladies ask for it because it is "such a free bloomer."

Of course this class of geraniums are not popular as "house plants" because the individual pips look ragged and less attractive than the round flowered zonals; but out of doors they usually excel in larger trusses and freedom of bloom. For bedding I like single flowered geraniums in preference to double varieties; the general effect is a more brilliant display of color and bloom.

Cloth of Gold geranium is not commonly planted now-a-days, and yet it is a splendid bedder. In the full sun its

BAMBUSA AUREA

abundant leafage is as bright and clear a yellow as Golden Bedder coleus, while its dwarf compact spreading habit is all that can be desired. Flowers and trusses are small, but freely produced, of a rosy red color, contrasting well with the foliage, or they may be removed at pleasure.

I do not think much of variegated geraniums, or coleus even, for planting in a mass; there is where you want a decided shade or self color, but they often contrast well in lines, edging or planted singly. Many variegated plants possess rare beauty individually that is lost collectively.

GROVE P. RAWSON.
Elmira, N. Y.

The New Dwarf Cannas.

There is a promising future for these. They are everybody's plants—the poor man's and the rich man's. They are capital growers and continuous bloomers and their blossoms are quite showy, often glowing. And while they vary in height from about 2 feet to 4 feet, they are very sturdy and bushy. As bedding plants they combine gaiety with tropical luxuriance, and without the semblance of coarseness often peculiar to the robust forms of *C. indica*, and in this way they are fitted for small gardens as well as for large gardens and parks. Rain storms may prostrate the heavy gigantic cannas but the dwarf ones are never broken down or bedraggled, true, their blossoms are often impaired by dashing rains, but their recuperative power is wonderful.

They are peculiarly adapted for commercial florists. There is no need to dry them off in winter if we wish an increase of stock. We can grow them continuously and propagate every shoot. No matter how small the plants may be in May,

if they are healthy, they will make large plants in summer if planted out. But if we wish to merely keep them over in winter we had better keep the root stocks somewhat moist, just as we do *C. Ehemannii*, and not perfectly dry as we generally do the commoner form of *C. indica*.

To Crozy, of France, we are chiefly indebted for this new race of cannas, but within the last couple of years so much seed has been saved and many seedlings raised both in this country and throughout Europe, that I am inclined to believe we are on the eve of an indiscriminate raft of varieties. Last summer I was much interested in examining one of the most complete collections of these cannas in America, and the other day I went over to see them, and to find that this florist had also imported last spring every new variety he could find in France—\$150 worth, besides adding the new American ones. And I must say that I did not think some of the newest ones were as good as the older ones, and there seemed to be too much similarity among many of them, especially the crimson scarlet selfs.

I am not sure why they are called gladiolus-flowered cannas, for while they are as showy as gladioluses their spikes are not very compact. But dwarf cannas are often used as pot plants in France, and gladiolus flower spikes stuck into the pots among the canna foliage. If the soil is kept moist the gladiolus flowers keep in good condition for several days and can be renewed as often as need be. Of course as the cannas are growing plants they retain their foliage fresh and green. And this is quite a feature in house decorations.

The following varieties are all pretty distinct. Among them I have noted those that have been certificated by the

Royal Horticultural Society of London, for I have always regarded such a certificate as being one of the strongest recommendations that a plant can have:

Admiral Courbet, flowers large, yellow profusely spotted with red. Received a first class certificate, R. H. S. of London, August 28, 1888.

Antoni Crozy, rich crimson slightly feathered with yellow on lower side, petals not very broad.

Adrien Robine, splendid dark crimson foliage, quite as dark as that of Senateur Millaud. The only variety we have that has not bloomed yet.

Adolph Wieck, vigorous grower; large showy glowing crimson or crimson-scarlet flowers.

Capricieux, flowers crimson, edged and flaked with golden yellow. Certificated by R. H. S., August 28 last.

Eduard Andre, crimson foliage; large red flowers.

Epi d'Or, buff and reddish. A handsome blossom but not a very good color.

Emile Leclair, of sturdy, vigorous, though dwarf habit; has large, showy, yellow flowers much spotted with bright crimson.

Francisque Morel, showy vivid crimson-scarlet flowers. Certificated by R. H. S., August 28 last.

Felix Crousse, crimson lake, lower petals slightly spotted with yellow. Petals not very wide.

Flamboyant, crimson-scarlet, lower petals slightly marked with yellow.

Grandiflora picta, large yellow flowers freely spotted with small red markings.

Francois Lapeute, crimson-shaded foliage; dark purple stems; vivid red-crimson flowers.

Guillaume Couston, flowers showy, yellow, spotted with red; vigorous.

General de Neigrier, flowers crimson-scarlet, foliage crimson.

Geoffrey St. Hilaire, flowers large, orange-scarlet, fine; very dark foliage. Certificated by R. H. S., September 25 last.

Louis Thibaut, flowers yellow, freely, and about the middle of the petals heavily spotted with red; dwarf habit.

Madame Just, flowers large, buff shading to orange. Certificated by R. H. S., August 28 last.

Louise Chretien, flowers large, yellow, freely spotted with orange. Was in splendid bloom in Botanical Gardens in Washington a month ago.

Paul Bert, flowers glowing crimson-scarlet, large, showy; foliage bronzy green. Certificated by R. H. S., September 25 last.

Revol Marsot, bright reddish crimson flowers slightly streaked with yellow.

Senateur Millaud, large, dark bronzy foliage and bright crimson flowers.

Ulrich Brunner, very large, glowing, crimson flowers. Certificated by R. H. S., October 9, last.

Victor Hugo, flowers rich vermilion; foliage bronzy green. W. F.

Bambusa Aurea.

Bambusa aurea is the name of a hardy bamboo that is grown a good deal around Washington. There are some fine clumps of it seven or eight feet high at Arlington. It is a native of China and named *aurea* because of the yellowish color of its stems. I do not know whether or not it is hardy as far north as New York, but as it costs only 25 cents a plant, and Saul has lots of it, I'm going to try it anyway. *Bambusa Metake* often survives the winter at Boston. W. F.

Keeping Down Mildew in Summer and Planting.

Many rose growers seem to have difficulty in keeping down mildew during the summer months but it is really a simple matter if properly attended to. My method is as follows: Upon the first indication of mildew, in the early morning—from 7 to 9 a. m.—when the sun is shining on the house, I give the plants a good syringing, closing the house up tight. Then placing a half pound of sulphur in the center of half a yard of cheese cloth I gather up the ends making a sort of loose bag, and with hand elevated well above the plants I shake the bag so as to fill the air full of sulphur. This beats the bellows for practical use. The house is kept tight until the temperature is raised to 100° then gradually ventilated—moderately at first. This treatment if persisted in will eventually harden the plants so that they will stand abundant ventilation. I ventilate so freely now that the winds blow directly on the plants and have no trouble from mildew.

A frequent cause of mildew is from over-wet and over-dry spots in the rose beds. Frequent, thorough examinations of the soil should be made. Take a trowel and dig down to the bottom in suspected places, for often while apparently moist the soil may be as dry as dust at the bottom. Where such are discovered a good drenching should of course follow, for if they are allowed to remain the plants there lose vitality and are soon covered with mildew. But with equal care guard against over-watering which produces equally bad results.

When young roses are first planted on the bench I believe in forming a little hollow around them to hold the water, and watering each plant separately. In this way you avoid the risk of getting all the soil saturated and in danger of becoming soggy before the plants are growing strong enough to use the water except that within their then limited reach. Of course after they are growing strongly and the roots are reaching out in all directions the whole bed must be watered. I believe in very shallow beds for roses simply because the danger of over-watering is thereby lessened. According to my idea there should be little necessity for drainage as the plants should receive no more water than they can use, and it is certainly unwise to leach all the strength out of the soil.

I also believe that when planting young roses on the bench the "ball" should never be left intact as it frequently hardens and cripples the root growth. I wash all the soil off my young roses and plant them carefully, spreading the roots out, taking care that the soil is in a properly moist state before allowing it to come in contact with the roots, and find that such make a more immediate and better growth than when planted as they come from the pot.

I suppose every florist now appreciates the value of lime wash in his benches and on the sides of his houses. I use it freely, giving each house a liberal application inside each year, and never fail to give a

good thick wash to the inside of all benches before replanting for another year. It is cheap, easy to apply, preserves the wood and kills and keeps out lots of insect pests.

Normal Park, Ill.

F. F. SMITH.

Rose American Beauty—Mme. Ferdinand Jamin—Mme. Jamin—or, a Lesson in Nomenclature.

In the July number of the *American Garden*, page 250, Mrs. J. S. R. Thomson, under the head of "Some Roses in Carolina," has this to say:

"Mme. Jamin I can recommend as a grand rose which I rarely see offered. It is of a deep dark claret, velvety red, though with me not a vigorous grower. It is exquisitely lovely, of a pale flesh color on the petals, which, when open, instantly remind one of the rich, deep, mottled glowing color in the heart of water melons."

Whereupon in the August number of the same journal, page 293, Mr. J. C. Vaughan retorts as follows:

"ROSE MME. JAMAIN (AMERICAN BEAUTY). If Mrs. J. S. R. T., who writes of the rose Mme. Jamin, will try American Beauty she will find Mme. Jamin all right. Why in the name of honest dealing should not the name American Beauty be dropped forever, instead of perpetuating the disgrace which certain florists of this country brought upon us by introducing this old sort under a new name?—J. C. Vaughan."

The resemblance in names has evidently misled Mr. Vaughan. American Beauty is considered by good authorities to be identical with Mme. Ferdinand Jamin, not Mme. Jamin. There are two distinct roses under the name of Mme. Hippolyte Jamin. One sent out by Guillot fils in 1869, a Tea variety and is described as being "white, tinged in the center with yellow." The other, an H. P., was raised by Garcon and introduced to commerce by Jamin in 1871, and is described as "white, tinged with rose." Neither of the two last named can be the one mentioned by Mrs. Thomson. In Ellwanger's Rose Book the description of Mme. Ferdinand Jamin is "deep rose, cupped form, highly scented." There are two other roses by the name of Jamin—Dupuy and Paul. Ellwanger describes the first as to color, "cherry red with a shade of crimson," and the latter, "crimson, slightly tinged with violet rose." Either of which might possibly answer the description of the Carolina rose.

It is not impossible that the rose Mrs. Thomson speaks so well about is American Beauty, but I am inclined to think that it is something else, for Mrs. Thomson in a concluding paragraph, mentions "Beauty" as among other roses which she has on trial, and in a note received from that lady dated August 5, she stated "I would hesitate to say Mme. Jamin and American Beauty were the same."

It is necessary for us all to be doubly cautious when correcting errors lest we fall into some ourselves. Truly, here are questions for an expert committee on rose nomenclature to solve. They can not be settled off hand. It takes years of experience, observation and research to satisfactorily straighten out many of the tangled up names among roses as they appear to-day, and it is to be hoped that the committee on nomenclature will at the next convention unravel some of the mysterious names which catalogues and horticultural magazines are cumbered with.

EDWIN LONSDALE.

Aug. 10.

Baltimore Odds and Ends.

The present season has so far been a most unfavorable one for effective bedding. I don't remember that we have been blessed—in this vicinity—with one single straight week of dry or good growing weather. I haven't seen much of the bedding in the public parks and squares about Baltimore, but in most of the private places visited I have found it very much below the usual standard. One gardener said to me last week that he hadn't known such a wet season in the thirty odd years he had been at the business.

Geranium Mme. Salleroi—always very liable to "miss" and damp off—has been a special failure wherever I have seen it this summer. It is a variety which I like very much however, and for the past two seasons we have been quite successful with it here. As soon as the plants begin to thicken up I have sufficient of the foliage removed to admit light and air about them; we have frequently cut them over completely, just as we would trim alternantheras, and although a little rough looking for a few days they soon bob up with a fresh crop of bright young foliage.

Some of the catalogues received last spring appeared to be giving a boom to Geranium "New Life." One catalogue described it as a variety "increasing in popularity" and "unsurpassed as a bedder." The florist who wrote that description and myself would not by any means agree in our estimate of this geranium. I consider it a good variety for the retail dealer to grow as a pot plant, as it is neat and dwarf in habit and the peculiar marking of the flower renders it very attractive, particularly to lady buyers, but it scarcely deserves to be classed as an A No. 1 bedding geranium.

Trade catalogues nowadays are in a general way very complete affairs, many of them indeed furnish sufficient information to make a first rate theoretical florist of any intelligent reader, but catalogue descriptions are not invariably reliable, the why or wherefore we don't propose to discuss at present. We would simply suggest that the trade in general would be greatly benefitted if florists who issue catalogues for general distribution would be careful to avoid "puffs" or exaggerated descriptions, which, however, they may serve as present aids in relieving us of stock, are very apt to injure our future trade.

And yet another mistake is that of filling up a catalogue with stock we haven't got to sell. I have in mind a worthy florist who before his recent promotion to the gardens of Paradise, did business in the Keystone state. His home trade amounted to nothing and he was therefore compelled to seek patronage abroad. He issued a catalogue, or more correctly, the same catalogue, every spring, but nine-tenths of the stock offered therein was stock that he hadn't and never did have on his premises. When an order came in he filled it by purchasing the items elsewhere, if he could profitably do so, otherwise his correspondent was politely notified that the stock ordered was completely exhausted. My friend used to regard himself as a wide awake business man, judging from experience therefore, I take it that all the "wide awake" florists have not yet been removed from this "mundane sphere."

I happened to be on hand a short time ago while a certain suburban florist was selling a lot of ferns. In giving directions for their proper treatment he par-

ticularly cautioned the purchaser against the use of manures or fertilizers in any shape or form, and, discussing the matter with him later, I found that he was hopelessly convinced that manure was death to a fern. I modestly hinted that I could show him a good and healthy collection of ferns as he would care to see, and ferns that were liberally supplied with liquid manure too. I use cow manure almost exclusively, and I apply it in liquid form to about every plant I grow. As to its use for ferns, I apply it tolerably strong once or twice a week, and results will have to be very different indeed before I change my practice. Most of my ferns are kept in small pots as being better suited for our purpose, and in order to keep them in condition I find liberal "feeding" an absolute necessity. In the application of liquid manure there is one general rule that I most rigidly enforce, viz: never to apply the stimulant when a plant is in that condition which we understand as "dry." When in this state a plant is generally injured more or less if liquid manure be applied, on the other hand I have particularly noted that if a plant, already "too wet," is watered with liquid manure the same soggyness the same sour, unhealthy condition of the soil which invariably follows over-watering is never produced.

Baltimoreans are largely occupied at present with arrangements for a grand exposition to be held here in September. A notable feature will be the "monster parade," intended to exhibit the industries and resources of the state, our florists don't propose to get left and a committee has been appointed to arrange for a suitable display on behalf of the craft. Although the affair comes off at a season of the year when florists have little time to spare we are getting to be such a live body as to render it certain that Baltimore florists will be creditably represented in the great trade display.

A. W. M.

News Notes.

CINCINNATI.—The Cincinnati Floral Co. removes to 163 Walnut St., Sept. 1.

POUGHKEEPSIE, N. Y.—Chas. Haible has leased the Dutchess Nurseries' greenhouses.

GALESBURG, ILL.—Pillsbury & Gesler are building a new greenhouse and will carry on a general trade here.

HORNELLSVILLE, N. Y.—Wettlin & Harrison have succeeded W. A. Wettlin, the latter having associated with him Mr. N. L. Harrison.

CHICAGO.—The American Floral Co. have opened a store at 225 North Clark street. Walter Kreitling's store was burned out the night of August 13.

BELLEVIEW, ILL.—Gust Grossart is building two new houses, one 70 x 10 and the other 70 x 15. E. W. Guy is rebuilding three houses and adding a new one 40 x 10.

SPARTANBURG, S. C.—Col. J. S. Thomson died August 22. His wife, Mrs. J. S. R. Thomson, is known to the trade as a grower of southern plants and seeds and through her writings for the horticultural press.

EAST LIVERPOOL, O.—Robert Luepke, formerly of Johnstown, Pa., and who lost all in that fearful flood is here endeavoring to get a start in business again. Is not this a chance for the florists of

America to show their generosity by assisting this unfortunate but worthy man?

ST. LOUIS, MO.—Mr. Henry Shaw died August 25, aged 89 years. Mr. Shaw amassed a large fortune in commercial pursuits and then turned his attention to the study and cultivation of plants, and it was incidental to these studies that the now famous botanical gardens in this city which bear his name became the property of the state. Another and perhaps more valuable gift made by him to the state was Tower Grove Park, a resort of great natural beauty. Mr. Shaw's estate is valued at \$2,500,000.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. References and copy order. Plant ads. not admitted under this head.

SITUATION WANTED—As gardener, 10 years experience in first class private places, good references; single. Address W. O. care Am. Florist.

SITUATION WANTED—As gardener, 14 years' experience; age 32; strictly temperate; good references. Please address J. G. H. care American Florist, Chicago.

SITUATION WANTED—By a first class German S. gardener, 15 years old, single, competent in all branches. Address H. S. care American Florist, Chicago.

SITUATION WANTED—By a practical and trustworthy man, as florist and gardener. Rose growing a specialty. References. Address J. S. HENNETT, Oakdale, Suffolk Co., N. Y.

SITUATION WANTED—A first class middle aged S. gardener and florist in open for engagement. Best of references; commercial or private. Address CHAS. SCHAFER, 254 Glenwood Ave. E. Orange, N. J.

SITUATION WANTED—By a single man; 12 years' experience propagating and forcing of roses and all the leading kinds of cut flowers. Good plant man. References if desired. Address F. N. care American Florist, Chicago.

SITUATION WANTED—Competent middle aged S. German florist and gardener wishes to engage by the first of September. Full particulars will be given by addressing W. K. care H. K. Krueger, 120 Callowhill St., Philadelphia, Pa.

SITUATION WANTED—A young man with some S. experience wishes to improve himself in rose growing. Will give a good offer to a first class rose grower and furnish best of references. Address ROSA, care American Florist, Chicago.

SITUATION WANTED—A Frenchman, 40 years S. old, single, competent in floral arrangement and nursery business as well as garden architecture, desires an active engagement. Address HANS BASCHOFF, 136 E. Broadway, New York.

SITUATION WANTED—As headgardener on small S. private place or as assistant; married; aged 29; understand propagating greenhouse work. Will work on private place; sober, trustworthy, good recommendations. A. B. care American Florist.

SITUATION WANTED—As foreman, private or S. commercial place, good rose grower and general greenhouse work. Also understands landscape gardening. 15 years experience. Best of reference. Address GARDNER, 943 Buttonwood St., Philadelphia, Pa.

SITUATION WANTED—By a first class young florist, single, German, with 8 years' experience in this and the old country, competent in all branches, good in making up floral designs; in a commercial or private place. Address G. D. care Jacob W. Grubb, Wheeling, W. Va.

SITUATION WANTED—By Swedish gardener with S. exceptionally good references, as orchid grower or headgardener. Good all-round hand. 12 years' experience in orchids, ferns, palms, stove and greenhouse plants, florist to flowers, bedding and herbaceous plants. Can grow and propagate roses in America, England, France, Germany and Sweden. Highest recommendations from Royal Botanic Gardens, Kew, and other prominent gardens. Address N. J. care American Florist, Chicago.

WANTED—Antennaria tomentosa, Cerastium tomentosum, Lythymachia nummularia urena. O. OLSSON, box 26, Austin, Texas.

WANTED—By thoroughly practical florist, position as superintendent, private or commercial place; salary required; first rate references. Address with particulars ALPHA, care American Florist.

WANTED—To lease small greenhouse establishment in a live town, a place where shipping facilities are good. Want to grow cut flowers exclusively; can furnish best of references. Address G. O. care Dayton Floral Co., Dayton, O.

WANTED—Gardener. Single, must be sober; to take charge of and run 2 greenhouses for flowers, 100 feet long. Experienced and successful in growing roses and carnations and making up flower pieces. Address with references, DR. G. W. LITTLE, Glens Falls, N. Y.

WANTED—A good second-hand hot water boiler in good condition, with capacity to heat about 600 feet 4-inch pipe. Also want man with necessary fittings, live prices and other particulars. J. W. DAYHOFF, florist, Hagerstown, Md.

WANTED—Experienced commercial florist as assistant foreman at Breer's Nursery, River-ton. The application of only first class men with ability and experience in commercial plant and best of reference will be entertained. Lock Box 1045. HENRY A. DREER, Philadelphia.

WANTED—A practical florist and gardener, must be competent to take charge of two greenhouses, orchard, flower gardens and a 5 acre park; must not be afraid to work; must understand flower raising in all its branches. Rose especially. A steady place for a right man. Compensation \$30 per month, with board and lodging. Address No. 34 Broughton Street, Savannah Ga.

TO LET—GREENHOUSES—4 greenhouses, hot beds and lot of ground, 7 miles from Philadelphia. W. J. FAIRY, Ferry, New Jersey.

FOR SALE—Greenhouse property; one location; good stock of plants. Only greenhouse in city of 10,000 inhabitants. MARY A. WAITE, Newton, Kan.

FOR SALE—In a booming city, a business controlling the trade of 5,000 inhabitants. No discount on it in any. 113 health only reason for selling. Price \$1,500. Mrs. J. B. B. 317 West 9th St., Pueblo, Colorado.

FOR SALE—Good established florist business with 5 greenhouses, a 5-room dwelling, 1/2 acre of land, large choice collection of plants, five blocks from postoffice, in Country Seat of 500 inhabitants. Address S. H. B. care American Florist.

FOR SALE—Or exchange for a first class greenhouse property, a beautiful southern home in the city of Denton, Texas, 2 story house and out-buildings, 3 acres in orchard, 1/2 acre in pond and water, a healthy climate. For particulars address P. O. Box 231, Denton, Texas.

FOR SALE—Or will sell stock for cash & rent cheap. Greenhouses with ground and complete stock, consisting of roses, carnations, geraniums, cuttings and general bedding plants, etc. Houses heated with hot water and built from most modern plans; situated in 3 blocks from 3000 people close to Philadelphia and Camden, near railroad station. Excellent opportunity, best reasons for selling. Cash, \$1,000 or easy terms. Apply early to A. T. E. 225 Vine St., Philadelphia, Pa.

FOR SALE—A rare chance for gardeners and florists. A well established and remunerative business, consisting of 6 adjoining lots in city, with a good dwelling, barn, 2 greenhouses with hot water furnace, a good well and hydrant water supply, 5 acres well cultivated vegetable garden within 1/2 mile from above mentioned premises. Large lot of choice plants, bulbs, trees, etc. 1 horse, wagon, cutter, sleigh, cultivator, seeder, garden implements for sale at a bargain. Apply early to Mrs. MAGDALENE DINGER, Eau Claire, Wis.

WANTED.

Florists will please send their Trade and Retail Lists to the

HOOPSTON FLORAL CO., Hoopeslon, Ill.

FOR SALE.

Five acres, two houses 18 x 100, shed, stable, dwelling, etc., all new, two miles from Denver, the best business town of the west. The property is a very good investment. This limited amount shown as the most heating for lung troubles. Address Box 10, Montclair, Colo.

WANTED.

A thorough florist to run my Greenhouses, or I will take such an one with about from \$300 to \$1000 cash, as partner; or will rent him my houses. They are new, in a good location, on one of the principal streets of Cleveland, with the best line of Electric Street Cars in the U. S., leading to it. Address J. D. SELZER, Brooklyn Village, Ohio.

James R. Pitcher and W. A. Manda have at their Nurseries and upon their Register, some excellent men, competent either as head-gardeners, orchid growers and assistants. Ladies and gentlemen requiring such, please address with particulars

THE UNITED STATES NURSERIES,
SHORT HILL, N. J.

HIGH EXPRESS CHARGES.

Now that shippers have been thoroughly posted in these columns as to how plants should be packed in order to be carried at a single rate there is little excuse for their packing in such shape as to cause the consignee to pay double rates. Still there seems to be considerable friction between buyer and seller on this account. This should not be. And under the circumstances the shipper is certainly to blame.

He now knows that when it is unsafe to pack in a tight box he can still secure the single rate for his customer by using a crate or a box with a crating over it. Surely this is not difficult to do, and certainly the cheaper you make your goods to the buyer the better he will be satisfied and the more likely you are to retain his custom, and the express charges are a part of the cost of the plants to the buyer. Shippers may rest assured that carelessness in regard to this matter will considerably lessen their trade. We trust that there will be fewer causes for complaint on this score in the future.

THE BEST GERANIUMS.

We have received a goodly number of replies in response to our note in August issue but we need many more, covering all sections of the country in order to make a summary which shall be of value. We therefore repeat our request and trust that every grower of geraniums will see the importance of complying with it.

In order to determine which geraniums are most valuable in all sections of the country for bedding we request each grower of these plants to drop us a postal card naming his best single scarlet, best double scarlet, best single pink, best double pink, best single white, best double white, best single any other color and best double any other color. Remember that the first requisite of a bedder is to stand the sun and look well through the summer. A full report can not fail be of great interest and value to all in the trade. Don't neglect to do your share. It will cost you only a moment's time and one cent.

THE CATALOGUE DISEASE.

In his "Baltimore Odds and Ends" A. W. M. tells of a small florist who catalogued a lot of plants that he did not have and when he received an order for them hustled around and bought them or politely notified his customer that the stock was exhausted. While this method of doing business is certainly not to be commended it is to be applauded as compared with the business methods of some other florists who catalogue a lot of plants they have not got, and when they get an order substitute what they have.

The catalogue disease is becoming practically an epidemic. Catalogues containing lengthy lists of varieties of all sorts of plants are issued too frequently by men who have barely enough glass to house more than one plant of each kind that they catalogue, and to such men the temptation to substitute must naturally be very great. And we can not but believe that such a business, honorably conducted, must be anything but profitable. The cloud of catalogues which bursts upon us every spring is getting to be truly appalling. Can it be possible that the authors of each and every one of these find it profitable? We doubt it, and believe that many small florists are unwise in indulging their wish to "have a catalogue just as well as Jones, and have a bigger one with longer lists of plants than his too!"

That the catalogue business is being overdone there can be little doubt, and in the present fierce competition it will soon be a case of the survival of the fittest. And we predict that the survivors will be those who have honest illustrations and descriptions in their catalogues, who eschew all bombast and exaggerations, and who conduct their business in a square, straightforward way, getting a fair price for a good article which will give satisfaction to the buyer.

Apropos of the manner in which prices have been cut by catalogue men in their "collections" of plants, bulbs, etc., we call to mind the observation of one of these gentlemen that a certain "collection" of bulbs he had catalogued, cost more to fill than the price received? We asked why he had catalogued the collection at such a low price and the reply was that he had "copied the collection out of some other catalogue and thought the man that issued it knew his business." Brilliant business man wasn't he?

THE PREMIUM LIST for the chrysanthemum show of the Society of Indiana Florists to be held at Indianapolis, November 5 to 9, is at hand. The society offers premiums to the amount of \$578, the principal ones being for "25 plants one of a kind, first \$75, second \$50, third \$35, fourth \$20; cut flowers, 25 of large flowering varieties, first \$50, second \$30, third \$20—12 blooms of each, to be on long stems; 25 new varieties of English and French origin—10 blooms of each in vases, one prize of \$50." In addition there are fifteen special prizes—\$250 in cash, a silver cup and a pair of vases. The silver cup is offered by Mrs. Benj. Harrison for "best new seedling chrysanthemum of American origin."

TUBEROUS BEGONIAS—Another lot of blooms of large size and good colors has been received from Mr. T. Griffin, Hackettstown, N. J.

Geranium Vagaries.

In the FLORIST of August 1, on page 598, we notice a few well made criticisms on the misspelling or naming of varieties by many of the leading growers of this country. The matter should certainly be more carefully looked after. Probably in nearly every instance these errors occur from carelessness, and not with the intention of misleading the customer; but in many cases the errors are so great that they simply amount to renaming the variety, hence causing much trouble and confusion to customers. This can be to a great extent avoided by a more careful reading of catalogue proofs.

It is commonly believed that the foreign catalogues are very accurate on this

score, but this is not true in many cases. The writer has now before him three catalogues, Mr. Henry Cannell's, of Swanley, Kent, Eng.; M. Bruant's, of Poitiers, France, and M. Victor Lemoine's, of Nancy, France, and I find by comparison that the same trouble exists (although not to so great an extent) across the water as in America, and that some of the mistakes made in this country are imported, as in the case of new double white variety, Baronne de Layres, which M. Lemoine spells as given, but on examining M. Bruant's catalogue we find he gives it as Baronne de Tayre, and as he is the originator of the variety we must concede his spelling correct. M. Bruant gives a variety as Heteranthus, Mr. Cannell gives the same as Eteranthus; M. Lemoine gives a variety as Etincelant, and M. Bruant the same variety as Eticelle.

We might go on giving many more mistakes of the same kind were it necessary, but many errors are made after the varieties are distributed in this country, as for instance New Geranium Bruant. Why Bruant when no such variety has ever been offered in France? And why new? Geranium Bruant was originated by M. Bruant, Poitiers, France, and sent out in 1883. We imported it from M. Lemoine and offered it in the fall of 1883 in this country under the correct name, Bruant. It is now nearly seven years since it was first offered in this country, hence why call it new? M. Bruant originated the variety, and still catalogues it as Bruant, and represents it with Mr. Blanc's cut of it made in Philadelphia.

We hold that the originator of a new variety has the sole right to name his own seedlings, and no one else has any right to add to, take from, or in any way change the name as given by the originator. Now let us call the grand old variety "Bruant," and in the future let each and every one of us that print a list of plants, either retail or wholesale, try and evade every error possible.

These same criticisms may equally well be applied to nearly every other class of plants offered in this country, and the remarks we have seen fit to make are intended to hit no one personally, but they certainly hit us all. In our own lists of last season (although we had prided ourselves on our correct spelling of the names) we find by comparing the names letter by letter with the originator's catalogues that we had a few errors, in nearly every case only one letter in a name being wrong, but nevertheless errors, and we shall, for one, the coming season use every care possible to have each name correct.

August 7. W. P. SIMMONS & CO.

Coming Exhibitions.

September 17-20, Boston.—Annual Exhibition Mass. Hort. Society.

November 5-8, Chicago.—Chrysanthemum Show Chicago Florist Club.

November 5-9, Indianapolis.—Chrysanthemum Show Society of Indiana Florists.

November 12-16, Philadelphia.—Chrysanthemum Show Pennsylvania Hort. Society.

November 12-14, Boston.—Chrysanthemum Show Mass. Hort. Society.

November 12-14, Orange, N.J.—Chrysanthemum Show New Jersey Floricultural Society.

November 12-16, Cincinnati.—Chrysanthemum Show Cincinnati Florist Club.

November 13-14, Worcester, Mass.—Chrysanthemum Show Worcester County Hort. Society.

CLEVELAND, O.—Henry L. Sonntag has built a new house 100x16 with packing room 30x14.

READING, PA.—D. H. Steckler has built two houses, one 20x60 and the other 18x60.

NASHUA, N. H.—A novel sight recently was a Nashua florist wheeling a load of funeral designs in a baby carriage.

MILWAUKEE.—Currie Bros. are giving their houses a thorough repairing. Archie Middlemass is erecting a windmill and tank for a water supply. Ben. Gregory and G. Volk are each building a new house for violets and pansies.

* HOOPESTON, ILL.—The Hoopes-ton Floral Co., capital stock \$10,000, has been organized here. The charter members are J. S. McFarren, A. H. Trego, T. S. Catherwood and Dr. Wilson. A. C. Wason has been employed as manager, and work on a range of greenhouses has been commenced.

LITTLE ROCK, ARK.—Geo. Vestal has purchased ten acres of land adjoining the city to be used as a nursery. The Arkansas Nursery Co., organized about two years since, is now in the hands of a receiver. The company was composed of business men of this city with E. T. Babcock as manager. D. M. Tipton is building a new house 20x100, and W. H. Herron one 25x50.

LIVE FLORISTS

Need good Catalogues, well illustrated, correct, stylish. No one does them better than the Florist Printer below named, to whom you can write for samples.

J. HORACE MCFARLAND,

Harrisburg, Pa.

JAS. BACKHOUSE & SON

THE NURSERIES, YORK, ENGLAND,

invite the attention of the American trade to the following *SPECIAL STOCKS*, for which they have long been famous:

ORCHIDS.

Comprising Cattleyas, Lælias, Odontoglossums, etc., which they offer in established plants by the dozen, hundred or thousand. Disas (the finest stock of flowering plants in Europe), and other popular genera in choice leading kinds together with many rare and unique varieties.

FERNS.

These have long been a specialty, and our stock of Tree Ferns, Filmy Ferns, Gleichenias, Maidenhairsts, and other popular kinds, is unsurpassed. Very moderate quotations can be given for grand specimen Tree Ferns; and for other kinds by the dozen, hundred or thousand.

Stove and Greenhouse Plants.

The leading kinds in large quantities. Special stocks of Red and White Lapaerias; specimen Camellias in all sizes, including large plants of Double Whites; Imantophyllums (Clivias), Eucharis, Azalea roseflora and other fine varieties, Rhododendrons, etc.; together with extra strong plants of stove and greenhouse Climbers.

Alpine and Herbaceous Plants.

For many years we have given special attention to gathering together an extensive collection of the most popular plants of Old English gardens; whilst our collectors and correspondents in the Alps, Pyrenees, Tyrol and other mountainous districts of Europe; as well as in Asia Minor, the Caucasus, Turkestan and Siberia, India, Japan, Australia and New Zealand, have enriched our stock, which for extent and variety is unsurpassed in the Trade. Of Auriculas, Campanulas, Delphiniums, Fritillarias, Narcissi, Phloxes, Primulas, Pyrethrums, Spiræas, Iris, Hellebores, etc., etc. We cultivate the choicest kinds in large quantities.

Evergreen & Flowering Trees & Shrubs

in the best and hardiest varieties are extensively cultivated, including North American, Japanese and other CONIFERÆ which our soil and climate admirably suit. Also Hardy Climbers in great variety.

FRUIT TREES

are also largely grown in the best and most productive sorts.

VEGETABLE SEEDS.

Peas, Broccoli, Cabbage, etc., of the newest and best varieties.

Our representative, MR. S. MARSHALL, expects to visit the States, arriving about end of July, and will be happy to wait upon purchasers, or send special quotations on application. Address, GRAND CENTRAL HOTEL, NEW YORK CITY.

[Mention The American Florist.]

Everything for Florists.

My Greenhouses covers now two acres solid in glass. Having built and rebuilt them in the best possible style with iron rafters, iron posts and iron supports for benches, using mostly large double thick glass, thus requiring very little wood and giving all the light and air possible, and having divided my establishment in several departments, each with a competent manager, I am enabled to supply the retail florist the coming season with everything that he needs, thus assuring him fresh stuff and lessens greatly his expenses for ordering and freight. I have planted 25,000 Roses of the best varieties, including Woottons, also 5,000 best Hybrids, 10,000 each of Carnations and Violets, 3,000 each of Bouvardias, Primulas, Mignonette, Daisies, Pansies. Also quantities of Allamanda Schottii, Poinsettia, Eucharis Amazonica and Orchids. Will have also large quantities of the best varieties of bulbous flowers, as well as Smilax, Asparagus and Lygodium Scandens.

My Decorative Department contains large numbers of Palms, Dracenas, Crotons, Pandanus, Ferns, etc., which will be ready in time for next season's use. Will also have a large stock of the best varieties of Roses, Geraniums, Carnations, Fuchsias, etc. for florists' stock.

READY FOR SALE NOW.

PALMS—Corypha Australis and Seaforthia Elegans, 5-inch pots, 18 inches high, 8 fronds, \$6 per doz., \$40 per 100, \$350 per 1000. Areca Sapida, 5 inch, and Cocos Campestria, \$10 per doz.

FERNS—Adiantum Pulvum, 4-inch, \$8 per 100, and Nephrolepis Philipene, 4 inch, \$15 per 100.

Twenty good varieties of ferns in mixture, from 2-inch pots, \$5 per 100. For winter flowering, Eucharis Amazonica, 20 bulbs in an 8-inch pot, \$1. Gardenia Florida, Allamanda Schottii and Clerodendron Balfouri, from 5-inch pots, \$3 per doz.

CUT ROSES—in mixture, \$3 per 100. Lycodium scandens, fine strings, 20c. each.

EVERYTHING CAREFULLY PACKED.

WASHINGTON, D. C.

Double Thick Glass and Hail.

It has been said by some florists that hail would not break double thick glass. I wish I could corroborate this, but my experience has been quite the reverse. In 1885 I had 500 lights of the best double thick broken by hail on a house having a total of 800 lights. Of course double thick will stand more than single thick, but even double thick will not stand such hail storms as we have here sometimes.

On July 27 this year I lost \$61 feet of glass by hail, but as I had availed myself of the protection afforded by the Florists' Hail Association my loss in glass was made good and I have great pleasure in acknowledging the prompt payment of the loss by the association.

HUGHES'
SOLUBLE FIR TREE OIL.

FLORISTS AND NURSERYMEN SHOULD
NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually
all parasites and insects which infest plants
whether at the roots or on the foliage, without in-
jury to tender plants, such as ferns, etc., if used as
directed. Used as a WASH it imparts the gloss and
lustre to the foliage which is so desirable on ex-
hibition specimens.

It kills insect life on man, animal, or plant, without
injury to the skin, wherever parasites may appear.

Elevation of Our Business.

BY ROBERT CRAIG.

[Read before the Society of American Florists at Buffalo, August 21.]

It is gratifying to remember that gardening, from the earliest times, has been fostered by the most intellectual and moral of the race, as an occupation, mentally, morally and physically, elevating in its character; from the earliest times the garden has been associated with all that is beautiful and good; the old story of the perfect man, completely pure and happy in the garden, whether it be a relation of an actual happening or only a beautiful figment of imagination, is the most beautiful picture ever conceived by the mind of man. We should have a proper pride in our connection with a calling so noble and should feel the responsibility that rests on each one of us to do what we may to advance the great cause in which we are engaged.

In considering the question how the society can keep on maintaining a high character for the business in America, I propose to glance at it in two aspects, our relation with each other and with the public. In our intercourse together as business men let us recollect that there is room for all who do good work and that jealousy should have no place, but the aim of each should be to deal equitably and to maintain pleasant and harmonious relation with all; one point is that our contracts with each other should be considered as sacred as the contracts in other lines of business are; in some cases we have been lax in this respect; contracts have been made, for instance, to supply a given number of plants or flowers at or within a specified time and not complied with, and the responsibility dismissed with the simple remark "that the cuttings did not strike" or "the dull weather prevented the flowers from opening," or some such flimsy excuse; these possibilities should be thought of before making an unqualified contract. I have frequently known serious losses to occur to the buyer from failure to supply on the part of a contractor; in no other business would this be tolerated or excused.

One feature in connection with our annual meetings that I believe would be desirable, is a market where stock can be sold by sample; buyers can better judge from sample than from description, and the meeting affords the best opportunity for growers from all parts of the country to show what they have to sell; it affords peculiar advantages to offer specialties that are unusually scarce; it has already been tried in our exhibition rooms to a very limited extent and proved useful, but will doubtless meet with general approval if suitable provision is made; everything possible should be done to make it worth while for those interested in the business to attend. Another

useful feature would be a bureau of information for the convenience of those seeking employment, or those who might wish to employ help. It is much more satisfactory to meet face to face than to communicate by letter. The business interests of horticulture require attention at the meeting, for the cause owes more to the enterprise and individual efforts of business men in bringing to light and in disseminating new plants and in cultivating the public taste by means of catalogues than all other agencies combined; the floral catalogues are a great power, they are eagerly studied, and as their statements embody truth or misrepresentation, their influence for good or evil is determined; on the whole, their teachings have been sound, in some instances exaggerated and false statements have been made, and wherever this has occurred it has been a detriment to the whole trade, as its effect is to create doubt in the accounts of all new things: the "cuts" of flowers, fruits or vegetables have sometimes been sad departures from the truth and I have known more than once of a catalogue man sending a "cut" made from a photograph back to the engraver with the instruction to make the flowers or fruit "a little larger and a good many more of them;" sometimes the same cut is made to do service in representing in a dozen catalogues as many varieties of plants. As a hopeful sign in this connection I may mention that a prominent firm last year had all its illustrations exact representations of photographs from nature. The verbal description should be carefully and truthfully made; anxiety to be the first to obtain a large sale should not influence to give glowing and misleading accounts of untried novelties. How many of the "great acquisitions" survive the second year? It is necessary to test well before sending out, in the meantime we have numbers of sterling and tested productions which are worthy of continued praise.

Another thing that requires our consideration as business men is the importance of each individual devoting himself to one or more specialties; the field is now so large that no one can reach the highest excellence in many departments; in law, medicine, architecture and other pursuits the necessity for and power of the specialist is felt, and while a good general knowledge is necessary, it is well for the individual not to spread his efforts over too much ground; the men to day in our business who reach the highest success are specialists to a greater or less degree; I do not mean that it is impossible to conduct successfully all branches under one management, for I believe the near future will discover more than one such firm, but each department will be under the control of a specialist.

In seeking to improve any class of plants we must not expect the improve-

THE ADVOCACY of hardy plants for bedding is not new, but that their use will soon greatly increase is probable. Mr. J. T. Temple, of Iowa, a close observer in floral matters, states that his trade in that state shows a decided improvement the past season on all lines of hardy perennial and herbaceous stock, while the falling off in the demand for soft wooded bedding stuff was as equally noticeable. Views expressed at the Buffalo convention touching this question certainly supported this position. The unusual amount of bedding plants carried over this season in many sections is an added proof that the florist must trim his sails for other breezes. We believe that those who offer a wider range for their customers' selection than geraniums, coleus and like stock will be the gainers for some time to come.

ment to be rapid or startling in its progress, it is usually a very slow and gradual growth; take the improvement of any class of plants, the geranium or petunia for instance, and the progress is so slow as to be hardly noticeable year by year, but in a decade we are struck by the advance. As a means of reaching and securing the co-operation of the public, horticultural exhibitions must ever be indispensable; this has long been recognized, but can not be too often dwelt upon. While their importance is unquestioned it must be admitted that the public is not yet educated up to the point of contributing reasonably to their support. Horticultural societies in this country and Europe are nearly all poor. The most successful one in the country is the Boston society, and if it had not a revenue independent of public support it could not flourish and be the power for good that it is; fortunately, through the wise investments of some of the earlier supporters, it now has a revenue that enables it to conduct its operations in a liberal way; Boston is unusually favored also in the fact that it has the Arnold Arboretum and the Botanic Gardens of the Harvard University to foster the public tastes, and who can doubt that the influence of these institutions has been a great factor in making that city the center of advanced horticulture in this country. Philadelphia is another favored city, as its Horticultural Society has recently become possessed, through the generosity of an estimable lady, Miss Elizabeth Shaffer, a sister of its late president, of the building known as Horticultural Hall, worth \$200,000, and entirely free from encumbrance; the income from which will enable the society to largely increase its usefulness. But all localities are not so favored, and in consideration of the fact that public taste is not sufficiently developed to sustain these exhibitions the question arises, how can they be carried on? The plan adopted by the City of Chicago of assessing a special tax for the support of the public parks, including quite liberal allotments for greenhouses and plants, is an admirable one and suggests a thought; the tax is cheerfully paid in view of the benefits derived; the great majority of the people of Chicago would not give up the pleasure derived from the floral features of the park for twice their cost; it is to be deplored that some of the money is so misspent and that in the midst of much excellent planting we find the most absurd designs of animals, ballet dancers, etc., made of plants, monstrosities capable of shocking even the sensibilities of a savage, but it is pleasant to note that these objectionable features are this year reduced, a healthier tone is being developed and doubtless these things will soon only exist as an unpleasant memory; on the whole the floral part of the Chicago parks are excellently and economically managed, an honor to the city and deserving of all the public support they receive. I can see no reason why the different cities throughout the country should not willingly place at the service of the local Horticultural Societies a suitable hall in which to hold their exhibitions; as an educational and moral force and as a popular branch of science, horticulture deserves such public support and encouragement, and the Florists' Clubs throughout the country can find no better work than to properly bring these matters to the attention of the "powers that be."

While considering the subject of exhibitions it is well to remember that we

are to have, in this country in 1892, the grandest affair of the kind the world has ever seen; there is no doubt that all former expositions will be eclipsed in extent, completeness and grandeur by the one that shall mark the 400th anniversary of the discovery of America; the products of the farm, mine and manufactory will be shown as never before, and it is gratifying to know that the importance of floral display in connection with the event is already appreciated by those having the matter in hand, and whether the great exhibition shall be held in New York, Chicago, or elsewhere, the members of this association should take a lively interest and should use their influence with the appointing power, to have at the head of the department in which they are specially interested a man capable of managing it so that it shall not fall behind the others.

Among the hopeful signs of the times is the great improvement in the horticultural periodicals, in their numbers and in extent of circulation there has been great advance; writers of great ability and industry are constantly presenting the claims of horticulture and diffusing information, the general press of the country is also ever ready at suitable opportunity to recognize the importance of the cause in which we are engaged; the manner in which proposed establishment of the immense Public Garden, by the Torrey Botanical Club in New York, has been endorsed by the press of that city and by leading citizens, shows that the importance of the undertaking is duly appreciated; if it can be completed according to the original design it will be one of the most attractive features of that great city and will be of incalculable benefit. It is proposed to expend the sum of one million dollars to be raised by subscriptions and to model the garden essentially after the celebrated Kew Gardens in England, in inculcating a love of plants among the people and in giving training to thousands of young men, many of whom have become shining lights in scientific and commercial horticulture; it is to be ardently hoped that those who can afford it will subscribe liberally to this great work proposed by the Torrey Club.

The country needs also to be more adequately represented by a National Botanic Garden, there is hope that the Botanic Gardens at Washington would, if its claims were properly presented in Congress, secure from the National Government the necessary support; it has been very ably conducted, with only meagre support, and has done much good, but in its present extent does not fairly represent a country growing so rapidly in wealth and refinement; as an association we should do what we can to help in this, as in every other direction of advancement. In considering the relative standing in artistic matters of this and foreign countries, the facts in the case give the florists of America some cause for congratulation; it is generally admitted that while the American constructive sense is superior to the European, the American decorative sense is inferior, and that in a general way the French excel us in tasteful arrangements requiring a keen conception of color, form and composition; this, happily, does not apply to the work of the best classes of American cut flower artists, nowhere else than in America are cut flowers so gracefully and beautifully arranged; the barbarous "wiring" of flowers is now nearly abandoned, and the blooms are used with long stems, clothed in the

appropriate setting of their own foliage; a great part of the work of this kind done in Europe shows a harshness and stiffness and a disregard for the harmonious disposition of color that is highly objectionable to the artistic eye. The indications are that at least a goodly proportion of our florists are waking up to the necessity of close study on these points.

A recent and very able writer on architecture has pictured a great future in America for that art, and has enforced his predictions with arguments from such an array of facts as to leave little doubt that his conclusions are correct; and if, as Lord Bacon puts it, "A man shall ever see that when ages grow to civility and elegance, men come to build stately, sooner than to garden finely," we can look to the future with confidence, giving our best thought and labor to the end that horticulture shall keep pace with the general advancement.

Echos From the Buffalo Convention.

Mr. Westcott believed that he had a good allowance of conscience having been in the business several years.

The society has lost only three members by death during the past year as against eight the year previous.

Laughter followed the announcement that all wearing the society's badge would be admitted to Forest Lawn cemetery.

"What has become of rose Her Majesty?" was a query which was greeted with laughter and treated as a little "jokelet."

Boston's invitation was extended by Wm. J. Stewart, on behalf of the Massachusetts Horticultural Society, and by Benj. Grey, on behalf of the Boston Gardeners' and Florists' Club.

Regarding light and heavy soils for carnations Mr. Swayne had used both in the greenhouse and could see no difference in results, but in summer he preferred the heavy soil. He plants firmly and cultivates freely.

Replying off hand to the query as to which azaleas were best for Christmas blooming Mr. Harris mentioned Deutsche Perle and Alba Indica as good whites and Mr. Van der Kruijzen as one of the best colored varieties for the purpose.

A resolution indorsing Dr. F. M. Hexamer, editor of the *American Agriculturist*, as Commissioner of Agriculture and John Thorpe as head of the division of horticulture for the World's Fair of 1892 was adopted by the convention, though with a protest from J. C. Vaughan, of Chicago, who claimed that if two New York men be indorsed for these positions Chicago should be given the location.

Regarding the sale of flowers on the streets Mr. Huntsman thought that the effect on the florist varied in different cities. In Cincinnati he did not consider it an injury. He believed that different classes of buyers were suited in different ways and that while cheap flowers on the streets might possibly shorten the florists' sales to a limited extent in summer, this was recovered with interest at other seasons through an increased desire for flowers fostered by purchases from street salesmen during the summer.

In describing the necessary qualifications for properly filling the position of grower in commercial greenhouses Mr. Henderson expressed the belief that one year's American experience was worth ten of European, as much of the latter must be unlearned in order to attain success here. For the position of head gardener on a private place he considered European experience preferable. He

J. M. JORDAN

considered gardeners a poorly paid class and he was not surprised that many of the most capable ones soon drifted into other lines.

The Exhibits at the Convention.

I couldn't help thinking as I walked about through the exhibition rooms that further attention should be given in this direction. True, the exhibits are staged to the best advantage and, so far as space and convenience permit, where they can be fully and freely examined by the public. But this is not enough. Before, between and after the meetings we may saunter through the exhibition rooms and see and examine a few of the things, but very few of us take time to examine everything; in fact there are many things we don't see at all.

Now we are a hard working practical lot of people and we want to know, and know critically, everything in connection with our business. We want to know every new wrinkle in glass and glazing, watering pots and hose, pruning shears, labels and tags, flower pots and vases, syringes and pumps, boxes and baskets for packing, and whatever else the mind of man may devise for use by florists and other horticulturists. The exhibitors of such devices by printed circulars or in person, explain the advantages of their exhibits over all other contrivances of a

similar nature; this is a matter of confidence on their own part and business.

The society appoints a committee to examine and report upon these exhibits and confer awards. This is all very good and an excellent card for the fortunate one who obtains a certificate of merit or honorable mention. But the society can go further and benefit the exhibitor and every member present. I would suggest that the several committees on exhibits make special note of what appears unto them as deserving of such, and on the second or third day of the convention that these special exhibits be brought upon the platform of the convention hall, and there, one by one, publicly discussed. In this I would not include the miscellaneous raft of exhibits, on the contrary, only such selections as the committees believe should, on account of their special merit or demerit, be brought to the light of the society.

In the case of boilers and other heavy, bulky or unwieldy exhibits that could not conveniently be moved, they could be referred to and discussed. We can not afford to invest blindly in anything; we want to know the disadvantages as well as the advantages of every appliance and invention; we want to know the weak points as well as the strong; we want the hard, attested facts as well as the plausible opinions. This is practical education. Inventors and manufacturers

who are sure they have got a good thing would court such criticism, whereas others with weak or shady articles would shun such light. W. F.

J. M. Jordan.

We have pleasure in presenting herewith a very excellent portrait of Mr. J. M. Jordan, the fifth president of the Society of American Florists.

Mr. Jordan was born in the state of Vermont and is now 60 years of age. His early life was spent on the farm. He was early obliged to maintain himself by his own efforts and since his 12th year has fought his own way in the world. He spent some years in the study of horticulture under Mr. Francis Brill, of Astoria, Long Island, who was one of the pioneers in the florist business in the year 1830.

He removed to St. Louis, Mo., in 1859 and opened a floral store in 1869; the first floral store in that city where cut flowers were kept constantly on hand. He has extensive greenhouses in the suburbs of St. Louis and grows a large proportion of the flowers he sells.

Mr. Jordan has been a member of the Society of American Florists since its inception and was a member of its first Executive Committee. He is a pleasant genial gentleman, thoroughly familiar with parliamentary rules and is a model presiding officer. His eminent fitness for the high position he now holds was recognized by the society in electing him to the highest office in its gift by a unanimous vote.

Awards at the Buffalo Exhibition.

FLORISTS' REQUISITES.

M. M. Bayersdorfer & Co., certificate of merit; Osman & Co., garden tools etc., honorable mention; W. C. Krick, immortelle work, honorable mention.

PLANTS.

Pitcher & Manda, orchids and stove plants, certificate of merit; Robt. Craig & Bro., palms, ferns, etc., honorable mention; H. A. Dreer, palms, ferns, etc., honorable mention; W. K. Harris, palms, ferns, etc., honorable mention; B. A. Elliott Co., tuberous begonias, honorable mention.

GREENHOUSE STRUCTURES AND MECHANICAL APPLIANCES.

Herendeen Mfg. Co., boilers, certificate of merit; Hitchings & Co., boilers, certificate of merit; D. E. Howatt, boilers, certificate of merit; J. A. Scollay, boilers, honorable mention; E. Hippard, ventilating apparatus, certificate of merit; Jewett Mfg. Co., ice box, honorable mention.

BULBS.

F. E. McAllister, general collection, certificate of merit; J. C. Vaughan, L. candidum, honorable mention; Peter Henderson, L. Harrisii, honorable mention.

HERBARIUMS.

E. W. Oliver, Washington D. C., prize \$100 and a diploma; J. H. Butterfoss, Lambertsville, N. J., prize \$50 and a diploma; J. H. Brumell, Carroll Station, Baltimore, certificate of merit. [The money prizes were given by Mr. Peter Henderson.]

FLOWER POTS.

D. C. Schofield, honorable mention; Whilldin Pottery Co., honorable mention; Detroit Flower Pot Co., honorable mention.

CUT FLOWERS.

Jas. Vick, gladioluses, certificate of merit; H. A. Dreer, new cannas, certificate of merit; F. M. Hine, Buffalo, pansies, honorable mention.

MISCELLANEOUS.

R. F. Lawrence & Co., bouquet holder, honorable mention; J. K. Kogge, hose mender, honorable mention.

Buffalo Notes.

BY WM. FALCONER.

IT WAS A pleasure to observe that among the five hundred florists who attended the convention there were none who were not interested in the proceedings. These gatherings are both pleasant and profitable.

AT THESE CONVENTIONS between Canada and the United States there is no boundary. We are one people, one great happy family, and meet together on one common basis—our mutual benefit and to know one another and love one another.

AMPELOPSIS VEITCHII was freely used for covering the stone and brick walls of houses, but not nearly so extensively as it should be or probably will soon be. The florists can get up a large stock expeditiously, and when grown in pots it can be transplanted to the open ground in midsummer with just as much safety as in spring or fall. It needs no special care and it is as available for the humble cottage as for the most pretentious mansion. And it clothes the stems of trees quickly and beautifully.

FOR VERANDA SCREENS the Virginian creeper holds chief sway, but occasionally I noticed purple clematises and common celastri. My attention was attracted to a residence on one of the principal streets and which, all except the roof, was completely covered with the densest mantle of Virginian creeper, even the upstairs windows were almost smothered out of sight with the vine. I thought this was a too free use of it.

NO FENCES, NO FLOWERS.—Could you have a more pointed illustration of this proverb than that of the principal residence streets of Buffalo? The entire absence of fences and the well kept belt of grass between the houses and the street impart a beautiful, broad and harmonious bearing. But grass and a few trees will hardly compensate the true lover of flowers for the sacrifice he is most compelled to make for fashion's sake.

VERANDA AND WINDOW boxes are quite a feature in Buffalo gardening; in fact in fenceless gardens but little other methods of flower decoration could be employed. They are well filled with "flowering" and fine-leaved plants and a drapery of vines, but I couldn't help thinking that the cannas and green leaved caladiums in a second story window were a little too high up.

THE GOOD FOLKS of Buffalo seem to believe in "Repose in gardening." There was no great floral display anywhere, neither in public nor in private gardens. Now this matter of trees and shrubs and broad fields of grass are all very well, but surely there is room somewhere for gay flowers and showy leaves. The meadows teem with golden rod, purple loose strife, swamp hibiscus, cardinal flower, sun-flowers, evening primrose, wild clematis, climbing hempweed, and many other seasonable flowers; these occur in nature's garden and in the greatest profusion, then why not these or something else in the artificial garden? At this time of

year we have hosts of Japanese lilies, white and blue plantain lilies, torch lilies, panicked phloxes, perennial sun-flowers, herbaceous clematises, perennial larkspur, coreopsis, pink sedums, and gaillardias among hardy plants; and asters, zinnias, verbenas, Drummond phlox, coreopsis, marigolds, mignonette, scabiosa, everlasting and balsams among annuals; and cannas, caladiums and large grasses for bold effects; and tigridias, gladioluses, Cape hyacinth and dahlias for gay blossoms; and passion flowers, Solanum jasminoides, moon flowers and other ipomæas, manettias and Lobbs uasturtiums among vines. These and many others, all desirable and easy to get and easy to keep; then why don't we use them more freely?

THE EXECUTIVE COMMITTEE.—The three new members of the S. A. F. Executive Committee appointed by President Jordan are Messrs. D. B. Long, Buffalo, N. Y., John Burton, Chestnut Hill, Pa., and Wm. Falconer, Glen Cove, N. Y. The committee is now composed of the following gentlemen: A. P. Calder, Boston; R. J. Halliday, Baltimore; J. M. Keller, Bay Ridge, N. Y.; J. D. Raynolds, Riverside, Ill.; Frank Huntsman, Cincinnati; J. T. Temple, Davenport, Iowa; and the three new members named above.

Seasonable Notes.

By the time these notes appear provision should be at hand to protect any and all plants that are out of doors, as it is very uncertain when the temperature will fall low enough to hurt buds. Looking over some old notes I find that in nine years once buds were injured by frost before the 20th of September, twice before the 25th, once before the 30th, and four times before October 10.

For market the thinning of buds must be closely pursued or they will get too large. The buds are easily displaced by pushing them aside with the end of the thumb. I am leaving on strong shoots of *Gloriosum* three buds, and in thinning I find that the average number of buds removed is 20. On strong shoots of *Triumphante* I leave one bud and the number removed is about 12. I mention these two varieties because of their different habits. There are a few varieties such as M. E. Nichols, *Mme. Damage* and *Virgo Marie* on which I do not thin the buds, but instead clean out all the weakly growth and crowded shoots. Now let me ask those who have never thinned to try it this year.

Specimen plants: The care in watering will be heavy for the next six weeks. I am always very careful to go over specimens first as soon as I get up in the morning, again about 10, then at noon, and then again after 5 o'clock, and often I find a plant requires at least two good soakings each day. If there are any bare or uneven spaces on any plant it is not too late to remedy by training if done at once.

Cut flowers for exhibition: A good many of the buds should now be in sight

and assuming a good size. Select only perfectly round buds where possible and in those cases where you have more than one bud to choose from select the best. See that the plants are securely tied and be careful not to break any shoots by brushing against them, as they will be very brittle for the present.

JOHN THORPE.

The National Chrysanthemum Society of America.

I am anxious to get ideas from all those interested in chrysanthemums before another moon, as to how we can best develop, take care of and further the interest we have at heart. I have an idea that the work will be easy and that we can begin this year.

It seems to me that we should have a committee of from five to seven in every city where a chrysanthemum grows, to examine collections during their flowering, take notes, correct names, spot seedlings and then at the close of the flowering season all data to be tabulated and distributed.

We want to give as soon as possible medals and certificates at every show. We want also to have a national chrysanthemum show each year to go from city to city; a week's show at popular prices and well managed should pay.

We are anxiously waiting for subscriptions, and Mr. Lane, of Chicago, treasurer, or Mr. Edwin Lonsdale, secretary, or myself will be pleased to receive \$2 or more from those who are interested.

THE AMERICAN FLORIST has kindly said that the babe needs suckling and that it will see it is not neglected.

Pearl River, N. Y. JOHN THORPE.

Mignonette.

Having received many letters asking for particulars as to the best way to treat mignonette to ensure getting the best results, I take this means of answering them all through the columns of the FLORIST, and I hope my correspondents will not think me discourteous in the matter, as all the letters were couched in very similar language and press of business prevents me answering each one individually.

To begin right is very essential. Have a good light airy house with the glass not over four feet from the surface of the soil if possible—less will be better. I use a narrow house, eleven feet wide, with raised beds on each side resting on the soil of the same. About 18 inches of good loamy soil is necessary to obtain really fine spikes of bloom. The soil if poor should be slightly enriched with well decomposed manure, about one part of manure to nine or ten of soil is ample; thoroughly incorporate the manure with the soil, rake the surface fine, tread or beat it firmly before sowing the seed.

Next make very shallow drills across the same at 18 inches apart; sow the seed very thinly and cover with fine soil about a quarter inch thick, press or beat the seed in firmly. Let the soil be fairly dry during these operations, and then give the whole a good soaking of water. Shade lightly from bright sun till the young plants show above the soil and keep uniformly moist, but not saturated. Many destroy the seed by letting it get dust dry after sowing it, common sense ought to tell them better. During this process, and at all times, give all the air possible day and night when the weather will permit. As soon as the plants are up and showing their seed leaves remove the shading altogether and give them the

WOOD BASKET OF WILD FLOWERS.

full benefit of the sun; this keeps the plants sturdy. Never let them get so dry as to suffer for want of water.

To keep butterflies out of the house I put a piece of common muslin mosquito netting over the opening of the ventilators on the inside, fasten it there with thin laths and leave it there till all danger from these pests is over. I then take it down and put it away till wanted again; this saves all trouble with caterpillars, which otherwise would entail constant picking every day which is a very expensive job.

Let the plants grow on steadily till large enough to thin out, and when this is done do not be afraid to pull out all except one at every 12 or 14 inches apart. As soon as this is done they will begin to grow very fast and in five or six weeks from the time of sowing will begin to show flower spikes at the leading shoots. As soon as the young laterals begin to show below the flowers carefully pick them out, this throws the whole strength into the flowers and causes them to develop fine long spikes.

As soon as the first spikes are cut the shoots below will in turn show flower very freely, which must be treated exactly as the first was if really fine spikes are desired. From this on they will need almost daily attention in disbudbing etc., and by this time the whole bed will be almost covered with the plants. As soon

as cool nights set in a very little fire heat will be necessary to keep the temperature at 40° to 45°, but under no consideration let the temperature exceed 45° at night if fine mignonette is wanted. Give all the air possible at all times, water when necessary with clear water—no stimulant is needed till the following May.

To keep the spikes straight some kind of support is needed—small brush similar to pea brush only much shorter is probably the simplest way of doing it, two or three sprays around each plant is generally all that is needed. It is very important that a really good strain of seed be sown or there will be so many worthless plants among them that the bloom will only disappoint, and so much time, labor and valuable space will be thrown away.

Summit, N. J.

JOHN N. MAY.

Wood Basket.

This is a genuine wood basket, originally made to hold logs for an open grate, but it is very well adapted to hold this beautiful collection of wild flowers, from New Jersey. Too often do we lose sight of the great beauty of simple flowers, because they have no commercial value.

It is well for us all to cultivate the habit of observing closely, and frequently when it is least expected we shall find the most delicate shapes and exquisite colors.

We have heard boys say, "I don't have a chance to make up," this inexpensive arrangement offers a field in which any boy can study if he has the desire; and he possibly would realize the force of the old saying, "Where there is a will there is a way." H. H. BATTLES.

Wine Bottle Cover.

The wine bottle cover illustrated in last issue represents a common straw cover that is used to protect wine bottles for shipping. Such covers can be had at any wine dealers. Care should be used to select only those that are not soiled, and that are not musty (as they frequently are); the odor would be disagreeable when filled, should they be so.

We generally cut the string at the largest end, and insert a heavy wire so that the opening can be shaped as desired. Some of the straws can be bent into studied carelessness. We have often used the rarest flowers in this arrangement; the contrast between the receptacle and contents is most striking.

The spider's web which we have been making for a number of years adds to some floral arrangements. When the web is sprinkled with water the effect is very much like dew; we have also used diamond dust on the webs and the effect under gas light can be imagined. These webs are made of very fine steel wire, and every retail florist should be able to make them; and I would suggest, that it offers a very good test of a boy's skill, and a good lesson in "manual training" to instruct him in making the same.

H. H. BATTLES.

Ruellia Macrantha.

When this plant was sent to me some years ago I thought it would not be much better than *R. formosa* or *R. speciosa* which, bearing small, insignificant flowers, would be of no value in our place and consequently no attention was given to it. The plant was in a 3 inch pot all summer and placed in a corner among other plants, where it got a little water occasionally and grew up in one long stalk. With all the hard usage and mistreatment flowers formed in December and I was astonished to see the large bright rosy flowers produced from the terminal leafaxils, continuing to open out for two months on the same head or branch. I determined to grow a few of the plants as a trial and found that we could sell them to good advantage at that season. We have but few blooming plants of any description suitable for house culture in midwinter, and as this ruellia is in no way particular as to treatment and is sure to bloom at the holidays, my opinion is that every retailer should grow it.

The flowers are large, trumpet shaped, of a bright rosy color, veined distinctly with dark purple, and although coming really from the axils of the leaves, yet when not examined closely appear to be a dense terminal cluster of bloom, the large erect flowers hiding the top leaves completely. The leaves are of a dark glossy green, somewhat pubescent, and are not apt to turn yellow or to drop off, and the habit of the plant is most pleasing, resembling a *justicia* in growth and foliage.

Cuttings root at any time in the year most freely, and by pinching in once or twice we get low bushy specimens and every shoot will perfect its flowers in midwinter at a time when other showy blooming plants are not very abundant.

Large specimens two feet high or more are very useful for church or other decoration, and the large heads of flowers are so conspicuous and stand out so bold above the foliage that everybody must admire them. The soil should be rather light but very rich and water be used freely at all times. We keep the plants outdoors in summer and on approach of cold nights give them room in an ordinary greenhouse without excessive heat. I have never noticed any insects on the plants and do not think that it has any special enemies of that description.

J. B. KELLER.

Rochester, N. Y.

Foreign Notes.

A beautiful day in June found an American lover of roses wandering through the rose fields of Messrs. Wm. Paul & Son at Waltham Cross, England. Being interested in the new varieties we were shown these first.

The variety *Marchioness of Lorne* attracted our attention at once as being a rose worthy of special note; this variety as grown at Waltham Cross exhibited all the free blooming characteristics of the Hybrid Tea section, to such an extent was this trait prominent that the writer failed to find a single shoot on the many plants in bloom that did not terminate with a fine plump bud. Not far distant were a group of *La France* and rows of other varieties in the Hybrid Tea section; a careful comparison showed *Marchioness of Lorne* equally as free flowering as any in the class mentioned. Your correspondent thought that here was the long looked for dark continuous flowering rose that should be to the American grower of cut flowers a most valuable variety; here was presented a rose with a good constitution, splendid foliage, a long pointed bud with exceeding broad petals, in color a most beautiful rich rose crimson. So impressed was I with the sterling qualities of this beautiful variety that I began to count my shekels both actual and prospective with a view to investing—Yankee like—my little all. Visions of prospective profits in the near future warranted an invoice of available cash with a view to investing in this section of royalty.

As it was too early in the season to get a price named I determined to have another look on returning from the Continent some six weeks later. On the second visit we saw our fair *Marchioness* in regal splendor and actually overloaded with magnificent buds and bloom. This was the case on all the plants, both old and young, in pots, and those in the open ground, close inspection showed every shoot—without exception—with an open flower, a beautiful bud or a bud in embryo. Mr. Wm. Paul honored us by his company and guidance on this particular occasion, and we felt he had just pride in his seedling the *Marchioness of Lorne*. In commenting on this rose Mr. P. said: "It possesses good habit, splendid constitution, is of a rich fulgent rose color, sweet scented, and is especially remarkable for its truly perpetual char-

acter, every shoot being crowned with a flower bud." Every word of which was true regarding his seedling. Some one will say that the Hybrid Perpetuals flower in that manner in England on account of the moist climate, which is true in a measure, but the *Marchioness of Lorne* was entirely unlike even the less pronounced varieties in the H. P. class.

On the writer's return to America, curiosity, in part, led to a visit to Mr. Peter Henderson's, knowing Mr. H. had bought a small quantity of this variety in June and that I should have the opportunity of seeing it in America under glass; judge the disappointment at finding the *Marchioness of Lorne* growing like all the other H. Ps. in this country without a trace of its free blooming character visible. Not a single flower had been produced on the two dozen or more plants Mr. H. had bedded on his bench. Thinking that perhaps through accident in filling Mr. H.'s order a mistake had occurred; immediately on reaching home I went at once to see how our plants of the *Marchioness* were progressing, and, lo, here they were, three feet in height and not a bud present or in prospect, and like Mr. Henderson's plants they had not produced a single bud or flower.

How are we to account for such a marked difference in the flowering character of this beautiful rose? is it to be attributed to climatic influences, to soil, to the intensity of the sun's rays, or what reason can be assigned? Will some one explain? We can in view of the facts above stated often misjudge and do injustice to worthy, conscientious men on the other side who have simply stated the facts regarding the roses they have introduced, and yet these roses through some influence(?) or other belie what is said about them when grown in our hot and burning sun.

Polyantha Rose: Clotilde Soupert. The polyantha roses are being more appreciated than a few years ago, and they now enter quite largely into the commercial sales of the rose houses. Some prejudice was begotten when these charming little roses were introduced by the varieties not having the strength or power to open their buds perfectly; but with the advent of the varieties *George Pernet*, *Gloire des Polyanthas* and the variety *Clotilde Soupert* some most charming additions to this interesting family of roses have been made. *Clotilde Soupert* is the result of crossing the polyantha rose *Mignonette* and the old tea variety *Madam Damazin*; it is of very strong vigorous growth, forming a nice shaped plant and attaining about 15 inches in height. The branches are not crowded as is the case with most of the polyanthas, but are more evenly disposed and when grown form naturally a nice symmetrical plant. Its color is a pearl white, shaded at times with silvery rose; it resembles the Hybrid *Noisette Boule de Neige* in form, and is almost as large when well grown. It is very free, quite fragrant and can not fail to be a splendid market plant for growing in pots for spring sales. It was raised by the Messrs. Soupert et Notting, of Luxembourg, where it is being grown in great quantity to meet the demand for it in Europe. It was so charmingly beautiful that an American catalogue man, quite well known to the readers of the *FLORIST*, purchased one third of the stock of this rose for dissemination in America the coming season. In addition to its suitability for market purposes it will be very useful to the flower worker, forming as it does nice

sprays of open flowers and half opened buds. We shall be disappointed if this variety with the other two sorts mentioned does not tend to popularize this section of the rose family.

Lady Mary Fitzwilliam: In England and in fact in many parts of the Continent this rose takes a very high place in the estimation of the rose loving public. Attesting its popularity in Europe are the great quantities of this fine variety in nearly every European rose nursery. As grown in England on the *Manetti* and *Seedling Brier* it attains a size and charm not met with in this country. It is too bad that it so readily succumbs to black spot in the open air in this country, in fact it is practically impossible to have it succeed in the open ground in our northern states. This is one of Mr. Bennett's roses and it is with pardonable pride he points to "one of his children" as being as popular as any other variety of rose in England. Its size when grown as "maiden"—i. e. first year's growth from the bud—is marvelous, rivaling *Paul Neron* in size, but of much better form and finer finish. There was distributed in England the past May two sports from *Lady Mary Fitzwilliam*, one called "White Lady" (Wm. Paul & Son), and the other "Maid of the Mist" (Henry Bennett). It is difficult to detect even the slightest difference between them, and coming as they do from two noted rosarians it is to be deplored that they did not "pool" the names if not the stock of the two roses. Intending purchasers can buy under either name knowing they will have the same rose from whichever quarter it comes.

The question was put and answered at the meeting in Buffalo: "What has become of Her Majesty?" I could not help recurring to the time of our first society meeting at Cincinnati, when Mr. May held aloft a plant of the rose in question which had made a growth of six feet or more in some six weeks time; then we had Mr. Peter Henderson's opinion of it cabled back from Europe ordering 1,000 of it at not a small price either. John Henderson, Mr. Craig and others attested the anticipated glories that lay hidden back in the dormant buds of the fine example of growth which was presented to view, all of which shows that as the old Scotchman said: "We gang aft aglee." I had a German friend who planted a portion of a house with this rose and who had promised me some wood for grafting purposes. When I went to get this promised wood he was in anything but a pleasant mood and curtly informed me he had "Trimmed Her Majesty mit a spade." It was his way of saying he had dug them up. After all the disparaging words I had heard respecting this rose and the disappointment it had caused I could not but feel pleased to see it in the garden of Mr. Bennett. He had a portion of a row of cut back—either two or three year plants—which were a sight to behold, and I am free to say I never saw anything finer in its line of color. It was the perfection of form and although very large it did not appear coarse, but it had a finish and a silvery gloss that I shall long remember. Her Majesty was doing fine in the Duchy of Luxembourg and was highly esteemed there. No one would blame Mr. Bennett a particle for sending out a rose which when grown nicely shows such beauty as Mr. B. brings out in his cultivation of this variety. It, however, mildews all over Europe and is generally discarded by the rose men as too difficult to grow.

E. G. H.

Seasonable Notes.

This is one of the most important seasons of the whole year to the grower of roses for winter bloom, as any neglect now will greatly damage the product for the whole season. The cool nights we are now getting, unless great care is taken, will result in a very abundant crop of mildew and black spot; in fact, the last is nearly always produced by just such conditions. Clear bright nights with the outside temperature ranging from 50° to 56° is sure to produce a condensed moisture in the greenhouse which, if allowed to continue many nights in succession, will certainly produce fungus in one shape or another, and black spot being the worst form of it great care should be taken to remedy the bad effect it has on the plants by making a small fire—just enough to expel the dampness from the houses; even when the temperature does not fall below 56° it is better to have a little heat in the pipes and leave a crack of the ventilators open, this produces a circulation of air and prevents the moisture settling on the plants enough to do them any harm. Many doubtless will think this is waste of time and fuel, but it certainly is not, for even on the ordinary pure tea varieties where black spot does not usually do much damage, it will save much trouble with the ordinary mildew, which is sure to affect them more or less, and if allowed to get started is very hard to stop till cold weather comes and strong fires are needed.

Avoid as much as possible having any surplus moisture in the house at this season by watering early in the day only, and then only giving what the plants actually need to keep them healthy. Give all the air possible during fine weather and endeavor to have a dry healthy atmosphere in the houses at night, this is really the best remedy for all fungoid diseases, especially those named above.

There is another disease which is very prevalent in some places at this season of the year and in the spring when the fires are allowed to go out too early. It is caused entirely by condensed moisture in conjunction with a stagnated atmosphere. It has been described in the *FLORIST* two or three times, but as many have not read it I will endeavor to describe it again. It makes its appearance after several nights when the moisture has been particularly heavy upon the young foliage; any one going through the houses early in the morning when the temperature ranges anywhere between 50° and 60°, will notice a very heavy dew all over the leaves and around the edges will hang little drops looking like pearls (many think their plants are the picture of health and looking most beautiful under such conditions). If this is allowed to repeat itself several nights in succession the chances are that when the sun has gained some power, say in the neighborhood of 10 o'clock, many of the young leaves, particularly on the strongest shoots, will look slightly wilted and, by 2 or 3 p. m. possibly, the whole bench will have the same appearance. If they are carefully examined it will be noticed that a slight discoloration of the stems has taken place and in 30 to 40 hours from this time more than half the leaves will be laying on the soil, and the fine promising looking plants of a few days before are sorry objects to look at. I have had many growers of long experience emphatically declare that the cause was gas from some furnace, or some particular kind of manure or fertilizer they

had been persuaded to use; in fact, they were ready to attribute it to anything except the right cause, which was simply condensed moisture; and this disease is always worse where the soil in which the plants are growing is a little too moist.

If this disease once strikes the plants bad, half your crop for the season is gone, as it will take them a long time to recover from its effects, therefore avoid it by a little careful treatment. One trouble there is to convince many of its cause is that exactly the same conditions in the open air produces the very finest roses, they not taking into consideration the difference in the conditions between the plants in a greenhouse and those in the open ground, which any one who will give the matter very little thought can readily understand.

Summit, N. J. JOHN N. MAY.

DUCHESS OF ALBANY.—A half dozen blooms of this new rose have been received from Mr. M. A. Hunt, Terre Haute, Ind. As far as the bloom is concerned it certainly merits the description of "an improved *La France*." It is a little deeper pink and of a more solid color than that long popular variety, has a similar fragrance and does not so soon present a ragged appearance. If the plant shows a corresponding advance in freedom of bloom and growth *La France* has a sturdy rival in this new comer.

Arboretum Notes.

VI.

The number of shrubs which bloom in late summer is very limited. The nursery in the Arnold Arboretum, which a few weeks since looked so gay from a distance, now appears only as an expanse of green. It is only by going down through the rows one by one that we come across a bright spot occasionally, just enough to show that there are a few things which can be depended upon for bright flowers even now, and that in reality there is not a day from early spring till late fall when by careful selection we may not have some shrub in bloom.

Among the most brilliant blossoms in August are the hypericums. Indigenous to our own country are *H. Kalmianum* from the Great Lakes, a shrub not exceeding three feet in height, with good foliage and bearing an abundance of golden blossoms from July to September, and *H. aureum*, a very large flowered species from Tennessee, also a new species from the mountains of North Carolina, bearing clusters of small yellow flowers somewhat resembling sedum. This latter is *H. fasciculata*. Then there is the European variety *H. hircinum*, particularly attractive on account of its long projecting stamens.

The hydrangeas are also among the most useful of summer blooming shrubs. Indeed by planting the various showy species a succession of bloom may be had continuously from June till September, beginning for instance with *vestita*, then following with *pubescens*, *arborescens*, *radiata* and its varieties, *paniculata*, and ending up with the well known favorite *paniculata grandiflora*. The above enumerated are all good and well worthy a place in any shrubby bed. And then the *callunus* or *Moor Heaths*. What can be prettier for rockeries or the borders of shrubby beds than these sturdy little plants! There are about thirty kinds to be seen at the Arboretum, the majority of them forms of *C. vulgaris*. They come in white and various shades of pink and lavender. They have been in bloom now for six weeks and are still looking bright.

And prettiest of all are the graceful little Killarney Heaths (*Daboecia polifolia*) with white or rose purple bells in loose racemes. A variety known as *versicolor* bears both white and pink flowers on the same plant and often on the same branch.

Tecoma radicans var. *grandiflora* is a great improvement over the old favorite Trumpet Creeper. It is a new garden hybrid recently imported from Veitch. The flowers are four inches across and foliage is of a handsome dark green.

Incarvillea Olgae, a genus nearly allied to the *tecomas* is also very showy when in flower. It is perfectly hardy with purplish flowers and subfruticose stems. It flowers in August and September.

Unexcelled in fragrance and strongly reminding one of the spring time are the *clethras*, with their showy racemes of white sweet scented flowers. The best are *C. alnifolia* (the commonest variety), *C. acuminata*, a southern species bearing longer flower spikes than the former although not so pure white in color, and *C. tomentosa*, also a southern species, which is the rarest of the three and the best for late bloom.

Among the clematises now in bloom are *Davidiana*, with its beautiful porcelain blue flowers, *graveolens*, with yellow flowers two to three inches across, which has been in bloom all the latter part of the summer and is now seen in fruit and flower at the same time, and *Pieroti*, a species from Japan which is now perfectly loaded with white clusters, handsomer every way and fully a month later than our own well known *Virginia*.

One of the best climbing plants now in flower is *Lonicera sempervirens* var. *fuchoides*. This is a decided improvement on the old evergreen climbing honeysuckle. The flowers are scarlet outside, with orange on the inside of the tube, the orange color turning to red as the flower gets old. It is a very profuse bloomer, flowering from every break.

Andromeda floribunda has its flower buds already set for next year, so far advanced that they seem apparently ready to open. It would seem that it should force readily. *Daphne cneorum* is now in bloom for the third time this year.

A climbing shrub that should not be overlooked is *Lycium Chinesium*, known as the Chinese Matrimony Vine. The flowers are small and purplish in color. The beauty of the plant consists in its long delicate pendent branches and the wealth of scarlet berries which adorns them, while at the same time it is thickly covered with flowers. Speaking of berries the *Viburnum opulis* is now very showy with its load of scarlet fruit, which is doubly valuable from the fact that they will remain, retaining their beauty till the buds break in the spring.

Standing out most noticeable among all the fruiting shrubs however is a novelty from near Tokio, Japan. It is the *Symplocos paniculata*, a shrub ten feet high and covered with racemes of oval berries about the size of huckleberries, but of a dazzling ultramarine blue in color. Such a color has never been seen on fruit before. A first class certificate of merit was awarded to Mr. Dawson for this shrub by the Mass. Hort. Society August 31.

WM. J. STEWART.
Boston, September 2.

Canna Flaccida.

I was very glad to read Mrs. Thomson's note in the last number of the *AM. FLORIST*, recommending *Canna flaccida* to the florists of the U. S. All that she says about its beauty and desirability I can most heartily endorse. As to its

appearance I must beg leave to differ. To me the flower looks more like the blossom of an iris. In fact I feel sure that any one familiar with the different varieties of iris upon seeing a *Canna flaccida* bloom for the first time would be almost certain to suppose it was a species of iris. The flower is very delicate, almost lacelike in texture and fades very quickly, opening about sunset and closing before noon the next day, hence is not very desirable for cut flowers. But where ever cannas are grown this species might be included and would add a pleasing variety, as the color is new in this family. W. C. STEELE.

Switzerland, Fla.

Diseased Asters.

What is the cause of the asters dying off so sudden when budded and seemingly very vigorous? Seem to be attacked in the stem close to the ground. The only visible marks of the disease is a brown or discolored spot on the stems. Have lost several every year. Tried on different soils. What is the best remedy to prevent it? F. A. D.

[We referred above query to Mr. M. B. Faxon, Boston, Mass., who grows the aster extensively, and who replied as follows: "Asters in this section have this season been badly attacked by the same disease that F. A. D. complains of. The disease is caused by a small worm which eats its way into the stem, killing the plant. There is no remedy that I know of, but fortunately as a rule not many plants in a bed are so attacked. I have lost many plants in this way, but the proportion has always been small. This insect does its work very quickly; a plant apparently all right one day being dead the next."]

Ants and Plant Lice.

The truth is not always on the outside. A person sees his plants wilting or blighting and notices ants running up and down the twigs or over the leaves, and at once concludes that the ants are the mischief makers. Often a still greater error is made. Plant or scale lice are seen and it is thought that the ants are parents to the lice. If we except the annoyance that comes from the visits of ants to the pantry, or their journeyings over the lawn where we wish to sit and rest, I think we may say that ants in our northern latitudes do us no harm.

Why then do we almost always find plants which are serving as a runway for ants infested with plant or scale lice, which latter by sucking the juices are a serious injury to the vegetation? The answer is not far to seek. The lice secrete a nectar—often as pleasant and delicious as the finest honey. The ants have a sugar tooth, and are not slow to find this delicious sweet. Indeed, the ants often watch over and care for these nectar-forming lice with as much solicitude as they show for their own young. In truth sometimes when danger threatens the ants will care for the lice before they attend to their own young. The ants show by their actions that their larder is dearer to them than their babies. In case of the corn root louse, Prof. C. M. Weed has shown that it is cared for by ants, and depends upon them in winter for its food and possibly for its survival.

We see then why ants gather on and about lice infested plants. For the same reason that the crow is attracted to the carrion, or the raccoon to the corn field.

It may be asked why the lice secrete such nectar. Animals do not usually form nutritious substances to throw them away. The plant stores up the albumen to nourish the germ. In no case is it probable that a nutritious product is formed except for a purpose. In this case the lice secrete the nectar to attract bees, wasps and ants, that these latter may frighten away bird or insect, that else would feed upon the lice. I have often seen this very thing illustrated. A fine linden just by our front door was sorely infested with scale lice (*Lecanium tilii*). We noticed that the sparrows and orioles were fast devouring the lice. Soon the lice commenced to secrete the nectar. The bees swarmed to the spot and the birds were soon frightened away. Thus the lice do not throw away the sweet, they use it to make and attract friends. Just as we never throw away sweet words.

These lice can all be killed by spraying violently with the kerosene and soap mixture, which is made as follows: To $\frac{1}{4}$ pound hard soap or one quart soft soap add one or two quarts of hot water and one pint of kerosene oil. Stir this violently till all is permanently mixed, then add six quarts of water. This is sure death to all plant lice, and very destructive to most scale lice.

In case ants are annoying on our lawns we can easily destroy them. Find their hills and by use of an iron rod or cane make a hole in the center to the bottom of the nest, now turn in a gill of bisulphide of carbon and quickly fill with clay and press this down so as to prevent evaporation. Soon all the ants will be dead. A. J. COOK.

Bedding Geraniums.

We believe the day has long since gone by when geraniums are looked upon as simply bedding plants, and that a variety should not be judged only from its bedding qualities. While we recognize the fact that there are some varieties that surpass others for bedding out purposes, there are also others equally as valuable for other purposes, such as winter blooming, for house culture, and also varieties for window boxes, veranda boxes, etc., and in their place surpass most of the bedding sorts for their individual beauty of color, shadings and form of flowers.

Noticing your request for reports on the best bedding sorts, I will submit a few notes, taken from my note book which I keep for my own reference, believing they may be of some value to your readers.

SINGLE VARIETIES.

Leon Perrault: This variety raised by Bruant, with brilliant scarlet flowers and trusses of immense size has taken the lead in the race for single varieties with us this year.

M. A. Godard: Sent out by Bruant in 1885; very dark red.

Perle: Raised by Lemoine, and is the very best white we have ever seen outside, being pure white in color, very free and a good healthy grower.

Mrs. E. T. Keim: Raised by W. A. Harkett, I believe, and is of dwarf habit and very free, pure white with pink eye.

Baron du Puynode: Belongs to the Bruant type, raised by Bruant in 1886; very large trusses and flowers on very stout foot stalks, color orange vermillion, with small white eye.

Alphonse Daudet: Lemoine's of 1887; very bright salmon.

Sam Sloan: Raised by Mr. Thorpe; dark red with crimson shadings.

Mon. Janssen: One of Lemoine's; very bright rose, base of petals white.

Mon. Alfred Mame: Very soft red, belongs to the Bruant race and is very fine.

Mrs. Lindsay: Raised by Mr. V. Burgevine, Kingston, N. Y., and is extra fine with us, very deep rose, base of petals white.

DOUBLE VARIETIES.

Heteranthe, commonly called Double Gen. Grant: This is with us far superior to Bruant, and the best of its color for bedding, while Bruant is the best in pots, having larger trusses and being a shade darker in color.

Mary Geering: Raised by Mr. Thorpe some years ago, and still takes the lead in its color, very soft rose pink, base of petals pure white.

Deruchette: Superb with us; pearly rose color, raised by Gerbeaux.

Gustav Widemann: Bruant's of 1884. Apricot with bright salmon shading.

S. A. Nutt: Raised by Mr. Thorpe. This I believe is the best dark red either as a pot variety or as a bedder yet offered, and it certainly has no equal with us.

Gloire de France: Raised by Lemoine, and the best of its color.

Les Huguenots: Silvery rose shaded lilac, on the style of Mon. Hardy.

Mon. Jovis: The best of the Mme. Hoste type.

Palmengarteninspektor Siebert: Raised by Pfützner. Dark red with flaming scarlet shadings, dwarf and very free.

Emile de Girardin: Best of the shade.

Geoffroy Saint Hilaire: Dark cherry red shaded with violet. Raised by Bruant.

L. Contable: Raised by Rosain; deep pure rose, very free, trusses medium size.

La Favorite: Lemoine's; is the best double white with us, being a good healthy grower and pure white in color, excelling the variety Le Cygne.

Richard Brett: Has no equal in the orange scarlet class outside. Raised by Mr. Thorpe.

Conseiller Galy: Bruant, 1883; clear brilliant currant color.

Mon. Francois: Lemoine, 1886; cinnamon red.

Centaure: Lemoine, 1887; brilliant rose, immense sized trusses.

Other varieties that have received marks of merit are as follows: Fratelli Ferrario, Mary Hill, Camen Jaquet, Heros d'Usagara, Sergeant Blandan, A. Dupre, M. Adrien Corret, Mon. Press, Bastien Lepage and Le Cid; these are all semi-double varieties.

During the past few weeks we have had hot and very dry weather, and being unable to water our geraniums by hand the list above represents varieties that have had a very severe test, and comprises only such varieties as are a blaze of flowers, and have held their foliage up to date. W. P. SIMMONS & Co.

Geneva, O., Sept. 3, 1889.

Experimenting.

"We are taken in so often by advertisements that it makes us shy of buying," writes one of your subscribers. Much of the pleasures of horticulture are obtained in experimenting, and everyone who experiments should be prepared for losses and disappointments; in fact these unpleasantnesses are part of the joys of gardening, they are experience—personal knowledge that cannot be eliminated from the mind, that no theory or book can controvert, you "have been there and you know." Unless you can afford it, stick to the things you know person-

THE CONSERVATORIES OF GOLDEN GATE PARK, SAN FRANCISCO.

ally; at the same time if you can spare a dollar or two a year, get something new and which you think may be valuable to you in your business, but don't build any hopes upon it, if it turns out well it is gain, if ill, it is experience. Knowing of whom to buy and whom to trust is business intuition. And if there is anything you don't know about but wish for information regarding write to the FLORIST.

W. F.

New York Notes and Comments.

The enterprising street vendors who used to sell the "alligator tree of Florida," otherwise liquidambar, are now out with a new novelty. They are selling bunches of a fleshy green plant, strongly scented, as the "Texas musk plant," or any other title that suggests itself. Examination shows it to be common samphire (*Salicornia herbacea*), which may be gathered by the bushel all along the coast. It is artificially perfumed, probably by the same stuff which turns everyday parsnips into "attar of rose seed" in the hands of these same sellers. This rechristened samphire sells well, too; truly, there's nothing like a little humbug. Probably many of the people who buy it would not think of wasting their nickels on familiar garden flowers, which have something besides oddity to recommend them.

Just now there is little besides gladiolus to be seen in the florists' windows, but a big bunch of herbaceous sunflowers recently noted were very handsome, and a little unusual. Casual observers took them for chrysanthemums. The flower rather suggests a very double China aster in size and shape; the color is the usual deep golden yellow. Really a very handsome thing, not so coarse as the ordinary double sunflower, but the plants make a handsome group for the garden, and the flowers are really useful when cut.

If the cyclamens are not popular this coming winter a good many people will be sorely disappointed. A great many of these plants are being grown, and a good many very fine ones. Poor strains are not worth growing, and beauty of foliage is every bit as necessary as beauty of flowers. The really good strains have leaves as well marked as *Begonia Rex*. Another important desideratum is neat habit; limp or straggly growth ruins the plant. The ideal cyclamen for the trade should have well marked leaves of good substance, growing closely, and large flowers on long stiff stems. Many other-wise good plants are lacking in substance. The rich dark flowers seem to be especially liked. They ought to be popularized among small amateurs as well as in the choice city trade, for there is no doubt of their excellence in a room, as well as in a small greenhouse.

Regarding the national flower, the writer has received opinions from so many hundreds of different sources that the subject is becoming a veritable nightmare. People seem usually to want their own favorite flower, without any regard to race, color or previous condition of servitude. It seems as if the Nova Scotians had rather got ahead of us when they appropriated the Mayflower, which is so closely connected with American history, though its comparatively narrow range prevents it from being representative of the entire country. One correspondent of the *Philadelphia Times* speaks of this plant as being disqualified, because it is also found native in Ireland, but she must confound it with the true arbutus or strawberry tree. *Life* suggests the shamrock as being very appropriate, and quite as American as many of our most patriotic citizens. Such candidates as violet, rose, pansy or laurel are quite out of order, though the last named has many supporters, who probably confound the true laurel with our handsome

native kalmia. According to the opinions received, the largest support is given to the golden rod, while the sunflower is a good second. Of course our most important native plant is really the tobacco, and a handsome thing it is, too, but this is 'way behind in the race. Somebody suggests the toothsome peanut, the maize or the cotton. But nearly 70 per cent of the opinions received by the writer favor the golden rod, the remaining 30 per cent scattering all over the garden flora. There is hardly likely to be any one flower universally recognized without legislative action in the matter.

This summer the fountains in the squares and parks of New York are beautified by aquatic plants, and though they are not always up to the mark they are a very great improvement. The lotus looks well, and the same may be said of several exotic lilies. It would add to the usefulness of these ponds if there was a greater display of native aquatic plants; people are as a rule very unfamiliar with them, though there are plenty of showy things among them. Certainly the taste for aquatic plants is increasing, and he is a wise grower who prepares for it. Generally speaking, there has been but little in the way of trade novelties this season, and we have gone several months without hearing of a remarkable new rose—something unusual.

That *Souvenir of Wootton* will be thoroughly tried next winter; it is already viewed with much favor. Mr. Roehrs expects to do a good deal with his new hybrid. It looks as if rather more large roses would be grown next winter.

Several growers have had rose houses in full bloom during June and July, especially *Perles*—not just crops of stragglers, but the full bloom same as midwinter. It may pay or it wouldn't be done, yet one would hardly expect much money in it.

EMILY LOUISE TAPLIN.

Boston.

Mr. Hugh Dickson, representing Alex. Dickson & Sons, of Belfast, Ireland, has been spending a few days in Boston.

Some of our prominent rose men are growing Duchess of Albany under number on the sly for next winter. It is a good rose.

The annual exhibition of the Mass. Hort. Society will be held September 17, 18, 19, 20 at Horticultural Hall. Premiums in the fruit and vegetable department amount to about \$950; for flowers and plants \$500.

W. C. Wilson's annual sale will take place on Wednesday, September 18, at the auction rooms of Sam'l Hatch & Co. On Friday, September 20, F. Sander & Co. will have an orchid sale at the same place, and September 25 R. J. Halliday comes with palms, azaleas, etc.

The weekly Saturday shows at Horticultural Hall closed with that of August 31. There have been some remarkably fine displays of specialties. Mr. J. W. Clark's gladioluses, L. W. Goodell's dianthus, phloxes and zinnias, Geo. S. Tuttle's pompon dahlias and R. & J. Farquhar's collection of asters have been equal to the best ever seen here.

The annual meeting and election of the Gardeners' and Florists' Club of Boston was held on Tuesday evening, September 3. Unusual interest attached to the choice of officers in view of the proposed meeting of the national society in Boston next year. Officers were elected as follows: President, A. P. Calder; Vice-President, W. E. Doyle; Secretary, J. J. Cunningham, Roslindale, Mass.; Treasurer, P. Welch; Librarian, W. J. Stewart; Executive Committee, L. H. Foster, J. H. Morton, F. L. Temple, Robt. Farquhar.

Labor Day was taken advantage of by Mr. Edward Hatch, the auctioneer, to invite a party of his florist friends to his summer cottage at Scituate. It was the "same old crowd" of merry boys that is always on hand in Boston when there is a good time in prospect. And a good time it was. Steamed clams by the bushel, lobster salad, baked potatoes and "fixins" including good appetites were there, and full justice was done to Mr. Hatch's hospitality. The airy piazza facing the sea furnished a comfortable place for those who wished to try their fortunes at "high, low, jack," and the rocky beach supplied all the requisites for a bowling match or a rough and tumble race. It was a sight to melt the heart of a graven image to see such a row of 200-pounders as Norton, Ewell, Cox, Rough and Mathieson indulging in a potato race. It can not be described. It should be seen to be appreciated.

The Buffalo convention has been the talk of the town since the Boston delegation came home. The universal verdict is that it was the most enjoyable occasion of the kind they ever participated in. The trip out was a memorable one. The climax was reached when at 10:30 p. m. at Rotterdam Junction the cars containing the New York delegation were attached to the train. The New York delegation will probably remember the occasion for many a day, and the representatives of the Hub are not likely to forget it. Unstinted praise for the Buffalo brethren for their excellent management and their open handed hospitality is heard every where. The business part of the convention comes in for its full share of praise and the trip to Niagara was all that had been promised for it. Coming home many of the delegates took the opportunity to stop off at Rochester

to see Geo. Savage, who welcomed them with his accustomed heartiness and showed them through his superb collection of orchids. Many also stopped at Albany to pay their respects to the grand old man Mr. Wm. Grey, who with his right hand man, Mr. Goldring, was ready to welcome and to entertain. Louis Menand also received many visitors, who came away full of enthusiasm over their reception. The standing of the Boston delegation was materially heightened by the presence in the party of Mr. Jos. A. Dirwanger and lady, of Portland, who made the occasion their bridal trip.

W. J. S.

Radiant Heat.

The late Commodore Vanderbilt was sometimes asked how it happened that he always got the best of his rivals in Wall street. The old gentleman was wont to reply "them dashin' young fellars don't see things as they be." In dealing with scientific questions it is particularly necessary "to see things as they be." There are certain aids to accurate vision that it will not do to dispense with. We must know the meaning of the words we use; we must understand the nature of proof and be able correctly to estimate the value of evidence; we must use correct mental processes and think with precision; sound elementary knowledge of the subject under discussion is desirable. Common sense and common observation have no place in science, in that connection they generally mean uncommon ignorance.

The article upon overhead heating on page 547 affords an excellent illustration of the confusion that is sure to follow the neglect of these self-evident truths.

Quotation marks should always contain the exact words used, misquotation is intolerable. I did not use the words quoted at the beginning of Mr. Whittall's article, nor anything like them. Of course we have to help out the sun's heat sometimes, but that is a secondary matter; if the sun did not furnish us with any heat at all we could get on just as well, using the heat stored up for us ages ago. Our flowers would cost more and that is all. It is the light of the short winter days that we are after, and we build and heat our houses in order that we may avail ourselves of it. From a purely commercial standpoint the long winter nights and the cold storms are quite as necessary as the sun's light, for in successfully meeting these adverse conditions lies the very foundation of the business. It is the fact that we do not and can not imitate nature, but raise our flowers in spite of her, that makes the trade possible.

The sun's energy reaches us in the form of rays, some of which are visible and some not; we can see the light rays, but not the heat or chemical rays. These rays are identical in every respect, except in the frequency of their vibrations, that is, the light rays if they vibrated slower or faster would become heat or chemical rays. It follows from this that if the heat does not come from above but is generated at the surface of the earth the same must be true of the light. We can see, however, that it is not so. Furthermore, about one half of the sun's heat is absorbed by the atmosphere and does not reach the earth at all.

A slight acquaintance with the properties of the burning glass or lens would have saved Mr. Whittall his unlucky illustration. The lens has the effect of bringing the sun nearer the earth, just as a spy glass has the effect of bringing dis-

tant objects nearer the eye; all the experiment shows is that if the object placed in the focus was moved a certain distance nearer the sun it would take fire without the intervention of the lens, in other words the nearer you get to the sun the hotter it is.

The comparison of radiant heat with the heat generated by the impact of solid bodies shows great unfamiliarity with the subject. But it is useless to prolong a discussion which can be finally settled by quotations from two of the most distinguished astronomers of the day.

Prof. Newcomb says: "In the time of Herschel it was not deemed necessary that the sun should be a very hot body, the heat received from his rays being supposed by many to be generated by their passage through our atmosphere. This idea is still entertained by many intelligent persons who have not made themselves acquainted with the laws of heat discovered during the present century, we may therefore remark that it is completely untenable."

Prof. Young says: "The energy radiated from a heated globe is found to be alike in all directions, and wholly independent of the bodies which receive it, nor is there the slightest reason to suppose the sun any way different in this respect from every other incandescent mass."

Mr. Whittall says, in effect, the sun is in a state of extreme heat, that heat comes to us in the form of waves, therefore it does not come from the sun at all, but is generated at the surface of the earth. This is not very brilliant reasoning. All this confusion seems to arise from Mr. Whittall's loose way of using words without regard to their recognized meaning. The word "generate" has a very precise meaning and can be applied in this case only to the original source of heat which is the sun; the word "absorb" is used by science to describe the effect when the sun's rays are intercepted.

In speaking of objects radiating back into space their surplus heat, inanimate objects were meant; every schoolboy knows that animals and plants are not on the same footing as sticks and stones. Animals and plants store up heat for future use. It ought not to be necessary to explain a detail like this.

The advocates of overhead heating do not found upon theory, but upon experiment. It is natural when anything new and unexpected turns up to look for the cause, several reasons have been given for the apparent superiority of this method, their value can not be estimated until further experiments have been made. It is possible that the removal of the 4 inch pipes from under the benches may have as much to do with it as anything.

The statement that certain rays from a hot stove out of doors would be lost to the earth is an error. They would be absorbed by the atmosphere and help keep the earth warm. Mr. Whittall implies that the statement in quotation marks in the last paragraph is the one made at the convention. Neither that statement nor anything like it was made. I supposed that the applause at the convention was genuine; the allusion that I made to it was "writ sarcastic," as Mr. Whittall would doubtless have discovered if he had not been blinded by grief.

Those familiar with the amenities of scientific controversy would smile at the idea of any one being offended at a little harmless chaffing. Theories are legitimate objects of attack with any weapon that comes to hand. And when a last

FLORAL TRIBUTE SENT TO THE FUNERAL OF THE LATE HENRY SHAW, OF ST. LOUIS, BY PRESIDENT JORDAN
IN THE NAME OF THE SOCIETY OF AMERICAN FLORISTS

century's theory gets out of its grave to raise its antiquated and hoary head in the midst of a society so progressive as that of the American Florists and, worse still, receives a welcome, some of us will feel constrained to laugh a little, even if it does bring tears of distress to the eyes of soft-hearted and sympathetic members.

Framingham, Mass. L. WIGHT.

The Double White Pyrethrum.

I have about four rods of this beautiful plant; I place it on the edge of my flower-

bed. It generally begins to bloom about the last of May or first of June, but this year we had everything frozen down to the ground in the last week in May, and again in the first week in June, so the pyrethrums didn't bloom till the second week in June. The first flowers are the finest; they run from three to four inches across. I sell the flowers but not the plants. There is not much demand for plants here and consequently prices rate low. I have never found any seed upon my plants. I propagate them by division. When the plants get large I

take them up and break up the clumps into many parts and replant.

THE AMERICAN FLORIST CO., Chicago.

SCIENTIFIC EDUCATION FOR FLORISTS.

At the Buffalo convention Mr. Hill endeavored to make plainer his position in regard to a scientific education for florists. What he desired to see was a training school to which young men could be sent to receive instruction in scientific matters bearing upon horticultural practices, after having first had some years of practical experience. He aimed at a combination of the practical and theoretical.

Mr. Henderson expressed the belief that the project was impracticable from the fact that there were no competent professors who had any practical knowledge of horticultural matters. To which Mr. Hill replied that he believed that the Society of American Florists had brains enough among its membership to supply the deficiency noted by Mr. Henderson and that with proper effort the society could induce the government to interest itself and make the required appropriation.

In the main we agree with Mr. Hill. Such a school would be a grand good thing and we do not doubt that qualified teachers could be found if the field was open to them. Further, we believe that by earnest and persistent effort the object may be finally obtained. Certainly no harm is done by agitating the subject and nothing will be accomplished without making a start. And there is no time like the present.

In the mean time every young florist in the land has the accumulated knowledge of centuries stored up for him in books. No science bears so directly upon the practical workings of our business as that of botany. How many young florists have mastered even the elements of this very interesting, and to them, particularly valuable science? We fear that they are not nearly so numerous as they should be. If your boys and girls have not had the advantage of instruction in the elements of botany you can make them no better present than a copy of Gray's *How Plants Grow*. Once get them interested in this charmingly written little book and if they have the qualities of mind which will make a suitable foundation for a scientific education they will educate themselves to a plane where they will be fit candidates for such a school as that desired by Mr. Hill and all of us. Once excite curiosity to know the cause of the effects which come under daily notice, supplying the books necessary to give the desired information and self-education has commenced. And facts which are dug out by the student in this way are fixed for more permanently in his mind than when the information is forced upon him.

Follow the methods employed by the lamented Agassiz. Give the pupil a plant and tell him or her to note on paper everything about the plant which can be

described. The pupil is amazed at the number of parts which compose the plant and the innumerable details which combine to make up its characteristic appearance. His interest and curiosity is excited and he thirsts for further knowledge. This needs no training school, it can be done at home where the greenhouses contain a wealth of material all the year round. Let us not wait for a training school but lay the foundations for a scientific education at home.

CATALOGUE ILLUSTRATIONS.

The plan recommended by the committee on "Exaggeration of cuts in illustrated catalogues" at the Buffalo convention was referred to the Executive Committee with power to act upon the matter according to its best judgment. It therefore depends upon the nine good men composing this committee whether or not some decisive action shall be taken by the society to afford protection to the honest catalogue man from the unjust competition of the author of engravings which lie.

Mr. Craig tells us in his essay that catalogue cuts have been sent back to the engraver to have the flowers made larger and more of them on the plant, and we are convinced that catalogue cuts are frequently made simply from a description—that is the engraver is told to make a cut like one already in existence, "changing it so that it will look different, but make the flowers larger and more of them, as this novelty is an improvement on that sort."

It has been said that the Society of American Florists has no right to interfere with the business affairs of individuals, and that it is preposterous for the society to attempt to dictate to catalogue men as to what their catalogues shall contain. True enough. But the plan is not to dictate to any one. It is intended merely to provide a means whereby an honest illustration may receive due credit for its honesty. As the case now stands exaggeration has been so commonly indulged in that many buyers of plants discount all catalogue engravings. Surely this is an injustice to the man who uses an honest illustration and is an ever present temptation to him to forsake the conscientious course he has pursued. We must protect him from such unjust competition and encourage him in his honorable course. At present he is working under a disadvantage, which is in our power to remove. Shall we sit idly by and refuse to exert that power?

Regarding the statement that plants and flowers vary and that it is human nature to "put the best foot forward" we would freely accord the privilege to do so. A committee could judge only by the specimens submitted with the engraving and if the specimen was equal to the engraving the committee would be in duty bound to certify that the illustration was true to nature.

THE AMERICAN NATIONAL CHRYSANTHEMUM SOCIETY.

This society which was organized at the Buffalo convention of the S. A. F., should accomplish much good. The rapidity with which new varieties of chrysanthemums are being originated and imported, many of doubtful value and in some cases the same variety under two or more names, is fast increasing our list of varieties to enormous proportions and some wise and systematic weeding must be done. And above all future

introductions should be admitted to our lists only after having been passed upon by some competent judges.

Certainly this can be accomplished in no better way than through a national society, which includes among its membership all the chrysanthemum specialists in the country and with such a practical and thorough plantsman as Mr. John Thorpe at its head. We believe that this society will award certificates of merit to new introductions so carefully and wisely that a variety so certificated will be received by the trade and the public with confidence that it possesses real merit, and that a failure to secure such a certificate will be equivalent to an admission of unworthiness to be classed as an advance on existing kinds.

We hope at no distant day to see an exhibition given by this society where introducers of new varieties may show them and have them passed upon by a committee of the society, who shall award certificates of merit to all which shall be deemed worthy and a prize of some kind to the variety which shall be considered the best introduction of the year. Why not make a start by having an exhibition of the kind this year in connection with one of the chrysanthemum shows in eastern cities?

The society should also publish a catalogue of all worthy existing varieties, properly classed and accurately described and give raiser's name and year of introduction where known. This should appear annually in future, adding the new introductions during the year and any new information which has been acquired regarding varieties previously catalogued, and dropping out varieties which have been superseded by new introductions of superior merit of the same class, color, etc.

Surely a society which can—and undoubtedly will—do so much valuable work deserves our earnest support, and it is to be hoped that every one interested in the chrysanthemum will make no delay in adding his name to the membership roll. The annual dues have been fixed at \$2, which entitles to all privileges of the society, and may be forwarded to Edwin Lonsdale, secretary, Chestnut Hill, Philadelphia, Pa.

"AS A SOCIETY we must set our faces resolutely against any practice that shall tend to destroy the dignity, or that may reflect dishonor upon the profession. If we shall refuse to act on these moral questions that confront us, then, as a society, we are doomed, and we shall deserve no better fate." The above from the address of President Hill at the New York convention should sink deep into the mind of every member of the Society of American Florists. If we "refuse to act," Mere condemnation amounts to nothing, *acts* are what accomplish results.

IT HAVING COME to our knowledge that the name of the AMERICAN FLORIST has been used as having indorsed certain individuals as well as certain plants or other stock offered by various parties, we desire to say that the FLORIST does not recommend any person or plant, and in no way indorses the opinions expressed by its correspondents. Readers will do well to look closely into the statements of any individuals who claim that they or their specialties are in any way especially indorsed by the AMERICAN FLORIST.

LET US NOT be too quick to cry down a project as impracticable because there are difficulties to be met and obstacles to be overcome before the sought-for benefit can be enjoyed. While some may be too

radical and occasionally visionary, others are too conservative, too closely wedded to old methods. Let us not be too radical nor too conservative, but endeavor to strike that happy medium which is productive of the most valuable and lasting results.

IT SEEMS TO US that the word "objectionable" as applied to the practice of "renaming plants to suit the seller's purpose" falls considerably short of the mark. The practice named is robbery pure and simple, and the men that practice it are unqualified swindlers. Let us express our meaning in terms which can not be misunderstood.

ANTS AND PLANT LICE.—Feeling that the note appended to J. H. Wade & Co.'s query in last issue was not as complete and explicit as was desirable on such an interesting subject, we have secured from Professor Cook a few notes on the relations which ants and plant lice bear to each other and which appear in another column.

THE AWARDS to exhibitors at the Buffalo convention had not all been made when our list of exhibitors was prepared for last issue. See complete list in another column of this issue.

THE LACK OF TIME for discussion of Mr. McMillan's paper at Buffalo was generally regretted. Some notes thereon have reached us and will appear in next issue.

SEEDSMEN passed through Chicago: J. Comont, London; T. Webster, W. C. Langstaff, T. C. Wendell, of Plant Seed Co.

News Notes.

COLORADO SPRINGS, COLO.—S. D. Bradford has added a new rose house 100 x 20.

SCRANTON, PA.—G. R. Clark & Co. will give a chrysanthemum exhibition at the Scranton City Guard Armory November 6 to 9.

ROCKFORD, ILL.—Melcher & Son have succeeded Wm. Melcher. They are building this season two new houses, one 20x100, the other 13x100.

SPRINGFIELD, MASS.—At the chrysanthemum show of the local horticultural society to be held November 14-16, premiums to the amount of \$250 are offered, competition open to all.

CINCINNATI.—H. L. Sunderbruch and family are slowly recovering from serious injuries received some weeks ago in a railroad accident. Mr. S. had his shoulder dislocated and a few bones broken; his little boy got off with a broken leg and Mrs. S. with a few bruises.

DETROIT.—The Detroit Journal announces that it has contracted for 2,000 Dutch hyacinth bulbs which will be distributed to children who will give the bulbs the necessary care to bloom them. Pots will be supplied with the bulbs and when the plant is admitted for exhibition at the spring show to be given under the auspices of the Journal the child will be given a free admission ticket.

NYACK, N. Y.—H. E. Blauvelt has this year built three rose houses, two 100 x 22 each and one 100 x 10. Mr. Winterbottom has sold his greenhouses to Mr. Mendle who is growing carnations mainly. Daniel Lynch has built one rose house 100 x 16, heated by hot water. John Foley, formerly with A. C. Tucker, has built two houses 130 x 18. H. G. Newton has leased his houses to his foreman M. Barry. Roses are growing finely and promise well for the coming season.

READING, PA.—Florist Joseph B. Moore has applied for a patent on a crude oil burner of which great things are expected. With this burner it is claimed that steam can be raised in 15 minutes by merely turning on the oil and applying a match, but in order to facilitate matters an air pump is used to furnish the pressure that is afterwards produced by the steam which passes to the burners in conjunction with the oil. The Reading Herald states that during a recent trial steam was raised in 8 minutes and in 15 minutes

the gauge registered 15 pounds pressure, and that 1500 feet of pipe were filled with steam, and the pressure held an hour by burning three gallons of oil (costing less than 2 cents a gallon).

A LITTLE BOOK in the Spanish language bearing the title "Cultivo de los Rosales en Macetas, traducciones hechas por D. Mariano Vergara" has been received. Having no Spanish scholars on our staff we are unable to appreciate its undoubted excellence.

R. F. M.—We are unable to name the insect which infests your La France roses, and recommend that you send specimens to Prof. C. W. Riley, Government entomologist, Washington, D. C., who will undoubtedly identify it for you. But pack better than the specimens sent us as they were badly crushed. We shall be pleased to know the name of the insect as given by Prof. Riley.

GERANIUM SOUVENIR DE MIRANDE.—Among the cut blooms of new geraniums exhibited by W. P. Simmons & Co., Geneva, O., at the Buffalo convention those of the new French variety Souvenir de Mirande attracted instant attention. The flowers are single, the lower petals a rosy carmine fading to white at the base, while the upper petals are white merely tipped with carmine. A most striking and handsome flower and very distinct from any previous introduction.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED.—By German gardener and florist; 10 years' experience; single; large private place preferred. J. H. care American Florist.

SITUATION WANTED.—By single man, age 34, 7 years' experience in florist business. Good references. Address A. H. O. care American Florist.

SITUATION WANTED.—By practical florist and grower; first class rose, carnation and violet grower; now disengaged. Good references. Address H. W. P. O. Norwich, Conn.

SITUATION WANTED.—By married gardener and florist, thoroughly experienced in all his branches. Address GEO. J. ANDERSON, 73 Sheffield St., Allegheny City, Pa.

SITUATION WANTED.—As gardener in private family; thoroughly understands his duties in all his branches. Well recommended. Address GEO. BARTOLOMEV, Batavia, Kane Co., Ill.

SITUATION WANTED.—By a first class gardener and florist, German, married, with small family, as a private gardener. Address GEORGE C., Florist, Flatbush, Kings Co., L. I., N. Y.

SITUATION WANTED.—By an Englishman as gardener. Have had good practice in cut flowers; also plant growing. 11 years in last place. Apply to WELCH BROS., 163 Tremont St., Boston, Mass.

SITUATION WANTED.—By a practical and trustworthy man, as florist and gardener. Rose-growing a specialty. References. Address JAS. P. HENNETY, Oklaide, Suffolk Co., N. Y.

SITUATION WANTED.—As foreman by a respectable young man, age 28; competent in the management of glasshouses, vegetable garden and pleasure grounds. W. FLETCHER, Jenkintown, Pa.

SITUATION WANTED.—A first class middle aged gardener and florist is open for engagement. Not of references, commercial or private. Address CHAS. SCHAEFER, 254 Glenwood Ave. E. Orange, N. J.

SITUATION WANTED.—By a single man as head gardener on private place; first class plantsman; 16 years' experience; age 32; speaks English and German. HANS SCHWALZ, S. Yacinebe, Quebec, Can.

SITUATION WANTED.—German gardener, age 37. Perfect in all branches of florist business. Open to do any kind of work belonging to a number one florist. Address HEIMANN KRUEGER, care Louis Rorer, Evansville, Ind.

SITUATION WANTED.—By sober and industrious man, age 27, as private gardener and commercial place. Have 6 years' experience in garden and greenhouse work. Address Wm. HELLMANN, P. O. box 350, Oak Park, Ill.

SITUATION WANTED.—By the list of October by a young competent florist, age 24, single, is foreman in commercial place; has long experience and extensive knowledge in orchid growing and general greenhouse work; is also a good propagator of greenhouse and stove plants. Best of references. Wages expected \$40. Address C. care American Florist.

SITUATION WANTED.—By practical rose grower who devoted all his lifetime to improve culture of roses; also very capable in growing all kinds of plants for cut or bedding. Single, age 33, French. Anyone wishing such a man, please address E. LEFEVRE, 408 S. Clark St., Chicago.

SITUATION WANTED.—By an Englishman as expert gardener; thoroughly understands the trade in all its branches. First class propagator and plant grower. Had great experience in building glass houses, and understands heating them in all cases and can fix them up. Not of kind of work. Private or commercial. Have been in some of the best gardens in England. Address CHAS. B. BURNETT, Central Valley, Orange Co., N. Y.

WANTED.—A practical florist in Central New York who understands building greenhouses. A trustworthy and single man preferred. Address K. care Vaughan's Seed Store, Chicago.

WANTED.—A first class florist; a good propagator of roses, and one well up in the art of cut flower work. Will require first class reference. Will insure a good man a permanent situation. Address A. GIDDINGS, Danville, Ill.

WANTED.—By thoroughly practical florist, position as superintendent private or public establishment; good salary required. Best of references. Address ALPHA, care American Florist.

WANTED.—A working gardener to take charge of small greenhouse and garden, and also to do all other work connected with the same. Must be experienced, references required. Address Box 74, Richland Center, Wisconsin.

WANTED.—Gardener (commercial). A thoroughly competent gardener with experience in raising flowers and propagating fruit trees, grapes, house fruits and vegetables. No one need apply if not thoroughly competent. Answer with references. Must be able to do all the work. A worthy man can secure a most desirable situation. Address P. O. Box 125, Woodbury, New Jersey.

WANTED.—Experienced commercial florist as assistant foreman; married man preferred; one of executive ability; capable of handling orders and capable of taking full charge of order and packing department is required. The position of only first class men will be entertained who furnish good references. Address HENRY A. DREER, lock box 1618, Philadelphia.

WANTED.—A steady, industrious and intelligent young man, with some experience in raising house work as an assistant, to take charge of a small place. To the right man this is a good place, and the opportunity to not only secure a good salary, but to exchange the extreme cold of the north for a very delightful climate. Address, stating qualifications and wages expected, B. WOODRUFF, Macon, Ga.

WANTED.—A first class vegetable gardener, who has had an extensive experience in raising market garden produce. Wants a man to take charge of same and know how to work men. Must come well recommended as to character and ability. Must be a night threman for greenhouses, and a man to work in same. Only sober, industrious men need answer. Address care American Florist, Chicago.

FOR SALE.—Two No. 15 Hitchings Boilers and 4100 cast iron pipe. T. R. HOPKINS, St. John, N. B. Canada.

FOR SALE.—Two Hitchings hot water boilers, nearly new, capacity 600 and 500 feet of 4-inch pipe. Price \$900 and \$800. Mrs. J. B. BAIN, M. R. SAUNDERS, Bradford, Ill.

FOR SALE.—In a booming city, a business controlling the trade of 50,000 inhabitants. No discount on it in any way. Ill health only reason for selling. Price \$1800. 317 West 9th St., Pueblo, Colorado.

FOR SALE.—A fourteen section No. 2 Exeter boiler with all fittings including safety valve, steam and water gauges, damper regulator, doors, etc., in first class condition. Only used three years. Cheap for cash. R. G. HANFORD, Norwalk, Conn.

FOR SALE.—200 feet 4-inch pipe, fittings such as tees, elbows, valves, etc., one new Zirnichel boiler capable of heating 1,700 feet 4-inch pipe, at very low price to clear out.

J. NEWMAN & SONS, 51 Tremont St., Boston, Mass.

FOR SALE OR RENT.—Three greenhouses and stock, near Camden and Philadelphia, in town of 3000 people, \$1,400, terms easy; or \$80 rent per month. Nearly new. Near New York. Address GOLD, best reason, FLORIST, box 18, Haddonfield, N. J.

FOR SALE.—Or exchange for a first class greenhouse property, a beautiful southern home in the city of Denton, Texas, 2 story house and out-buildings, 8 acres of orchard, some fruit, very fine, healthy climate. For particulars address P. O. Box 291, Denton, Texas.

FOR SALE.—A well established florist establishment in a live town in northern Ohio, 5000 square feet of glass thorough cultivated vegetable garden within 10 minutes of a much larger area of glass. All new, doing a good business. Address, Chicago, A. G. care American Florist.

FOR SALE.—A rare chance for gardeners and florists. A well established and remunerative business, consisting of a well built, airy, healthy, a good dwelling, barn, 2 greenhouses with hot water furnace, a good well and hydrant water supply, 5 acres well cultivated, with lots of fruit trees, 1 mile from above mentioned premises, a large lot of choice plants, bulbs, trees, etc., 1 horse, wagons, carriage, sleigh, cutters, etc., and many implements for sale at a bargain. Apply early to Mrs. MAUDALENE DINGER, Eau Claire, Wis.

FOR SALE.—Seven years established floral business, three greenhouses, $\frac{1}{2}$ acre of ground on street car line, centrally located, the collection of plants: winter roses in 30,000 inhabitants; but little competition; nursery in connection. Address: GEO. B. BOWMAN, Pueblo, Colorado.

FOR SALE.—A good established florist business in a city of 16,000 inhabitants; 5,500 feet of glass, good stock greenhouse and bedding plants; city water; houses heated by steam; all in good repair; business paying well. Good reason for selling. MRS. GEO. LOW, Stillwater, Minnesota.

MILDEW ON ROSES.

SING SING, N. Y., July 24, '89.

MR. BENJ. HAMMOND, Fishkill-on Hudson.
My Dear Sir—During the past season, I gave your "Grape Dust" a thorough trial in my rose houses. As a preventive of Mildew on plants, I regard it as superior to sulphur. It is more easily applied, adheres to the foliage better and seems quicker in its effects. If mildew is caused by weakness or an unhealthy condition of the plant or, as is often the case in the winter months, by keeping the soil too wet, it is unreasonable to expect any permanent benefit from the application of mildew mixtures; but when caused by a draught of cold air, or by a sudden change in temperature or other unavoidable circumstances, it can be eradicated if taken in hand at once. For this purpose I know of no more efficient remedy than Grape Dust. I should think you would find a ready sale for it when its merits become generally known.
Very truly yours,
JOHN HOAG.

Catalogues Received.

Wm. B. Hartland, Cork, Ireland, daffodils; James Vick, Seedsman, Rochester, N.Y., hardy bulbs and plants; V. Doppelt, Erfurt, Germany, seeds and plants; Siebrecht & Wadley, New Rochelle, N.Y., plants; R. Van der Schoot & Son, Hillegom, Holland, Dutch bulbs; Sam'l C. Moon, Morrisville, Pa., nursery stock; Currie Bros., Milwaukee, Wis., bulbs and seeds; Dr. H. Schroeder, Bloomington, Ill., nursery stock; Gardner & Sons, Osage, Iowa, nursery stock.

A copy of their catalogue of "new rare and beautiful plants" for 1889-90 has been received from Messrs. Siebrecht & Wadley, New Rochelle, N. Y. It contains 208 pages and is most liberally and handsomely illustrated throughout. The lists of orchids, ferns and decorative plants are very complete, and in addition there are good lists of greenhouse and hardy plants. It is certainly a credit to the firm issuing it. And a word of commendation is due to Mr. J. Horace McFarland, the printer, for its typographical excellence.

NEW DIRECTORY.

THE AMERICAN FLORIST CO. WILL PUBLISH A NEW EDITION OF THEIR WELL KNOWN TRADE DIRECTORY OF THE UNITED STATES AND CANADA,

and propose to issue the same in time for spring trade of 1890. All persons in the trade who know of any changes from former Directory, either because of errors in that or of new places, are requested to send us the same.

We propose, where possible, to state amount of glass owned by each firm; and all who report to us are urged to state amount they have in round numbers that we may insert the same in the Directory.

ADDRESS

AMERICAN FLORIST COMPANY,

54 La Salle Street, CHICAGO.

T. GRIFFIN, Begonia Grower, HACKETTSTOWN, NEW JERSEY.

PANSIES.

QUALITY HIGH.

PRICES LOW.

I attend personally to selecting the finest specimens only, for my seed bed, trying the various novelties and discarding those without special merit. Growing seed enough only to produce what plants I sell, I can make a finer selection than if grown in quantity.

From the sale of over **100,000 Plants** last season I have received numerous recommendations. Not one complaint.

PRICES: Good stocky plants from seed beds, 75 cents per 100 free by mail, \$5.00 per 1000 per express. Send for circular.

Office 717 Fifteenth Street, N. W., WASHINGTON, D. C.

New Orleans.

At the annual meeting of the New Orleans Hort. Society the following officers were elected: C. W. Bichling, president; C. Thomas, vice-president; Chas. Wise, recording secretary; N. Roberts, corresponding secretary; John Eblen, treasurer. The society is in a very prosperous condition and proposes to give its fourth annual exhibition the coming spring.

Maitre & Cook have dissolved. Mr. Maitre continues at the old stand, while Mr. Cook starts one square away. The latter is now busy building extensive greenhouses.

J. Bercegey has built at Covington, a few miles from the city, a large pottery. He will manufacture exclusively the standard pot as adopted by the Society of American Florists.

Business at present (August) is at a standstill, but prospects for a brisk winter's trade are promising. H. A. D.

THE SIXTEENTH exhibition of the "General Royal Union for the cultivation of flower-roots" will be held at Haarlem, Holland, March 21 to 25, 1890. Not less than 253 prizes, consisting of gold, gilt, silver and bronze medals, are offered in 105 classes.

Florists' Letters.

Emblems, Monograms, Etc. These letters and designs are made of the best immortelles, wired on wood or metal frames, having holes drilled in them to insert tooth-picks, by which they are fastened to the design. Give them a trial. You will find these goods to be superior to any in the market. PAT'D AUG. 6 1889.

NOTE—All infringers or imitators of the above letters and designs will be prosecuted to the fullest extent.

Send for Sample.

THERE is a most unfortunate and untrue belief existing in the minds of many people that cut flowers are at most times an expensive luxury. The injury worked to the trade by this impression is much greater than is generally known. Doubtless much of this has been caused by the sensational newspaper stories of extravagant uses of flowers. Certain it is that we need a remedy and every florist should whenever opportunity occurs, circulate the fact that at most times the best flowers are sold at a moderate advance on actual cost and that such prices do not reach the limits of extravagance.

CHRYSANTHEMUM shows are still gaining in popularity. Exhibitions with this year be held in Boston; Philadelphia; Orange, N. J.; Chicago; Indianapolis; Cincinnati; Detroit; Springfield, Mass; Worcester, Mass.; San Francisco; Columbus, O.; Newport, R. I.; Charleston, S. C.; and Sandusky, O.; and Buffalo is thinking it over.

Massachusetts Horticultural Society.

The annual exhibition of this society opened at Boston on Tuesday, September 17, continuing for four days. The weather was most unfavorable with the exception of the last day, and the attendance was materially decreased on this account.

The entrance to the hall was tastefully festooned with laurel, etc. The lower hall, with the exception of the stage on which was displayed a collection of choice evergreens from Mr. W. C. Strong, was devoted to the fruit and vegetable departments of the show. Taken altogether this section was very creditable, the pears especially giving evidence of having enjoyed a most favorable summer. The apples were unusually good, out door grapes were inferior, and the hot house grapes were not quite up to the average. Several bunches from Geo. McWilliams, of Whitinsville, were superb in size of bunch and berry. The best grapes shown were two bunches of Muscats from Jas Brydon, of Yarmouthport. They were very well finished.

In the upper hall the customary large collection of tropical and foliage plants was to be seen. The largest display came from Mr. W. E. Doyle, who now exhibited for the first time and, judging by the enterprise shown in this instance, will doubtless be an important exhibitor in future shows. His fine collection of palms, cycads, araucarias and pandanus made a grand effect in the hall, which, indeed, would have looked rather empty without them.

Next to Mr. Doyle, Wm. J. Martin, gardener to N. T. Kidder was the largest exhibitor. His collection comprised many plants with variegated foliage, which lit up grandly under the electric lights.

From Thos. Clarke and J. H. White there were also fine displays of tropical foliage plants. Mr. H. H. Hunnewell contributed a group of beautiful specimens, including a fine plant of that as yet rare variety, the variegated Dracaena indivisa. His dracaenas were awarded a certificate of merit.

There were some very fine ferns from Dr. C. G. Weld and N. T. Kidder, a plant of Davallia Mooreana from the latter being one of the finest specimen ferns ever seen in the hall. There were but few orchids. John L. Gardner, Benj Grey and N. T. Kidder being the only competitors in this line.

It is hard to understand, unless it is on account of the insignificant encouragement in the shape of premiums, why so few flowering plants are shown at these exhibitions. The foliage plants are all right but bright colors, such as are found in flowers alone, are needed to give proper brilliancy to the display. Ixoras, eucharises, dipladenias and other plants which might be named might be had in

splendid form at this season and would make most desirable additions to our too colorless displays.

The tank of aquatics contributed by H. H. Hunnewell, Benj. Grey and L. W. Goodell was as usual one of the features of the exhibition, and the beautiful nymphæas attracted much attention. But while the contents of the tank are so desirable the tank itself is a nuisance and disfigurement. It would take but little ingenuity and small expense to provide a place for the exhibition of aquatics more artistic and appropriate than a great rectangular green box.

The display of cut flowers was quite small, being confined chiefly to wild asters, callias, begonias and dianthus. Geo. S. Tuttle excelled especially in pompon dahlias, and those from Franklin Bacheller were also good. Some hydrangeas of a marvelous blue color were shown by W. C. Strong, R. T. Lombard showed some good blooms of the new white carnation Mrs. Fisher.

The premiums offered for table plants, vases of flowers and table baskets brought out some very nice exhibits in that line. The new incandescent lights were pronounced a great success.

The crotons, dracaenas and other plants with showy foliage lighted up with great brilliancy in the evening. W. J. S.

New York Notes and Comments.

Gabriel Marc, one of the wealthiest and best known residents of Newtown, Long Island, died at his home in Woodside on September 15. Mr. Marc was widely known among the older generation of florists, being considered the pioneer nurseryman of Long Island. He was well known as an importer of French roses and azaleas, having devoted much attention to the latter plant. He was of French origin and, like the venerable Louis Menand, was highly esteemed by his compatriots in the trade. Mr. Marc had amassed a fortune, and has been living in retirement for some years. He was about 60 years old. His death will be greatly regretted; he represented the conservative, yet enthusiastic generation of nurserymen now gradually passing away.

Mr. J. Fostermann, the widely known and popular representative of F. Sander, of St. Albans, has entered into business on his own account at Newtown, Long Island, as a grower of orchids and fine plants. Mr. Fostermann will find many well-wishers in his new venture.

Chas. F. Klunder, the well known Broadway florist, has recently failed. Liabilities and assets are at present unsettled, as no assignment has been made. Three of the largest creditors are W. S. Allen and Thos. Young, Jr. of New York, and Jas. Dean, of Bay Ridge. The

embarrassments spread over a good deal of time, and the creditors do not seem in a very sanguine frame of mind.

Owing to the unusually heavy rains outdoor flowers are pretty well over, and the injury to stock is quite large. A member of the trade who has gone in for an aquatic garden, was recently asked about his success in this line. He seemed to consider aquatics a failure through the wet season, and declared that his plants had been two feet under water for some time. It sounds queer to say that the summer has been too wet for aquatic plants, but such is certainly the case, and other stuff has suffered in proportion. It is noticeable, too, how sales always fall off when there is a period of wet and dismal days. The florists is certainly a fair weather business; people don't seem to think so much of buying flowers when kept indoors by bad weather, and the September rains have had a decided effect on the florists' pocketbooks.

A large trade sale was held at Astoria, by order of W. C. Wilson's assignee, in the latter part of September. It included a quantity of pandanus, as well as a general collection; a good deal of pandanus has been offered at some previous auctions in the city. It must be plentiful, and yet there seems a scarcity of certain useful sizes. Very often there is an overplus of small, poorly grown or dirty pandanus which meets with a very cool reception.

Mr. Samuel Henshaw has returned from England much invigorated by his trip. Mr. Jos. Towell has also returned from the Old Country; he spent three or four weeks in the United Kingdom, visiting most of the great nurseries. Thos. Young, Jr., is another returned voyager.

Mr. F. Mau, of Weehawken, the well known orchid importer, has been selling largely through the agency of Ang-Rolker. Mr. Mau has a very fine collection of cattleyas, among them over fifty good varieties of *Trianae*. The orchid trade has been quiet during the summer; it always seems at its best during cold weather.

Canna flaccida is very accurately described on page 64 of the FLORIST as strongly resembling an iris in bloom. The likeness is striking, and Mr. Steele does not rate it a bit too highly, but the ephemeral quality of the flower is certainly a disadvantage. The writer recollects seeing it at South Amboy (N. J.) some years ago, finely grown in a large general collection of cannas, but, while making a good show, the flowers were gone too quickly to be of great value. Probably it would do better in Florida than here, though we see very well grown cannas around New York.

So far we have heard nothing of an autumn flower show in New York, chrysanthemum or otherwise. There will surely be a good one at Orange, as usual; it seems a pity that prospects are not brighter in the metropolis. It is a pity, though, that Boston, Philadelphia and Orange should arrange to open their shows on the same day; so many florists like to see the opening day at each show, and not being Sir Boyle Roche's bird they can't be in more than one place at a time.

All the roses seen this month give promise of a very fine season coming; Perles usually look exceedingly well. The damp summer has certainly induced a good deal of mildew, but the plants are vigorous in spite of this. Madame de Watteville seems likely to prove more vigorous as it is better understood; it is certainly a popular rose, while Gabrielle Drevet, which made its first appearance

at the same time as the foregoing, is in a back seat. Drevet is really too small a bud for commercial purposes, though the color is pretty enough. Frignee seems very much in the shade already; the successful rival of Perle has yet to be discovered in spite of complaints against the latter. Duchess of Albany certainly promises well, it ought to take with the public as well as the growers.

EMILY LOUISE TAPLIN.

Buffalo Notes.

There was on one of the streets a large pot full of caladiums—a No. 1 pot or, perhaps to be more explicit, a 24-inch pot—standing on a plinth nearly the height of a second story window, hugging the cornice of a pagoda, the roof of which was in stripes of color, buff and brick red. Did you see this W. F.? I did and thought it characteristic, effective and in good taste. On the same street and nearly opposite was an oblong bed with one end to the street and the other towards the house, about 18 feet long and 5 feet wide. The margin was about a foot wide of *Alternanthera aurea*, a foot wide second row of *Iresine* or *Achyranthes Wallisi* and with a foot wide center of *Sivla serrata variegata*. It was chaste, beautiful and impressive, and I am sorry I had not Mr. McMillan with me, as I believe he would have admitted that there was a place where such planting was nothing but O. K.

Now just a word about the exhibition. It was the best arranged, the best managed, and the work of judging was done more expeditiously than ever before. We owe a great deal to our Buffalo friends for what they did for us, but for nothing more than the exhibition part of their labor. W. F. is right when he says that the most important exhibits should be noticed and displayed on and described from the platform.

We have found it very difficult hitherto to get awards completed, but now I think we have got well started and we shall do better each year.

One more word about that paper of Mr. McMillan's. It, as I understand, came very near being accepted as read and published in the minutes, I was informed by two gentlemen who had the pleasure of looking it over before the meeting that they thought it was so hot and had so much to say against coleus and that ilk that if the paper was read they would not be responsible for Mac. But the paper was read (and how it was read), and proved that florists can take a little cayenne at times in their even. I do not agree with all Mr. McMillan said, but I do say that it is one of the most important, if not the most important paper ever presented to the society. There is lots to say for and against this paper, and as it will keep there is time to discuss it in a future number.

JOHN THORPE.

The Florists' Hail Association.

The meeting of the Florists' Hail Association, like everything connected with the Buffalo convention, was a success. Members of the Society of American Florists at last viewed the Hail Association in its true light, that is, an organization for mutual benefit, which by its practical working has shown that it costs less to secure its members against loss than by any other known form of insurance. The secretary reported that the officers had not found it necessary to levy an assessment since the organization of the association, June 1, 1887.

After a careful review of the working of the association for the past two years the directors unanimously voted to recommend the following amendments to the by-laws: 1st that "Section 2 of Article 5 be amended to read \$500 instead of \$200;" 2nd, that "Members be allowed to increase their insurance by either one half or a whole assessment and members so increasing their insurance shall receive pro rata advance upon the amount designated in Section 1 of Article 7 as payment of loss." These amendments were unanimously adopted by the members at their annual meeting, which was held in Music Hall on Wednesday, August 21.

The second amendment is really a step in the direction of plant insurance, and if its future working meets the anticipation of its projectors the difficulties attending plant insurance will have been solved. The whole thing in a nutshell being, that if a man doubles his insurance on his glass he receives double the compensation for loss. If the glass is not broken of course his plants remain uninjured. If its future workings justify the removal of the limit, the most valuable plants may be insured by increasing the insurance upon glass. The secretary reported 1,327,240 square feet of glass insured exclusive of those who insured their glass at Buffalo, prominent among the latter being Wm. K. Harris, Philadelphia, E. Hippard, Youngstown, O., L. L. May & Co., St. Paul, and many others equally well known.

The directors elected were: J. D. Carmody, Evansville, Ind.; Peter Henderson, Jersey City, N. J.; B. F. Dorrance, Wilkesbarre, Pa.; Edwin Lonsdale, Philadelphia, Pa.; James Horan, Bridgeport, Conn., and J. M. Jordan, St. Louis, Mo.

The following officers were elected for the ensuing year: J. M. Jordan, St. Louis, president; Edwin Lonsdale, Philadelphia, Pa., vice-president; J. C. Vaughan, Chicago, Ill., treasurer, and John G. Esler, Saddle River, N. J., secretary. Mr. E. G. Hill was retired as treasurer upon his own request, because the duties of the office encroached upon his time. Much of the success of the association is due to Mr. Hill's untiring energy, his successor is one of the original promoters of the idea of hail insurance. The association is likely to make rapid strides during the ensuing year.

JOHN G. ESLER, Secretary.

Scientific Education for Gardeners, Etc.

ED. AM. FLORIST:—I see you again make allusion to this subject in the FLORIST of 15th September.

The question before we enter the subject is what is meant by "science;" few words have a greater latitude in definition. If exact science is meant, then it is exceedingly doubtful if it can ever be practically applied to either agriculture or horticulture. Phenology may be true, but it is now generally abandoned as a science, because the difference in temperament of individuals having similar phenological characteristics so changes the workings of the organs that no certain results can be got at, just as we know that soil may contain all the food for a certain crop, yet the crop may fail through adverse mechanical conditions of the soil, or extremes of temperature or moisture, that "science" is helpless to avert. True, when we are operating under glass there is more play for "science"—if we allow the use of the word to be applied to successful experiments. Ten years ago probably one half of all who tried rose growing in

A CURIOUS SPORT.

winter failed, few fail now since by experiment it has been found that four or five inches of soil are wanted rather than eight or nine. This was really a scientific discovery, because it was founded on experimental evidence, that the greater depth of soil could not be dried in winter, hence the roots rotted.

If we can have horticultural schools where actual experiments guided by men who have been "to the manner born," then I am with you every time, but if these schools are to be presided over by mere book students, who have no other claim to be professors of agriculture or horticulture than having graduated at Yale, Harvard, or even Amherst, then such schools and colleges are likely to be barren of good results. Mr. Hill says that he "believes the Society of American Florists has brains enough among its members to supply the deficiency." I entirely agree with him, and think Mr. Hill would make a capital superintendent of such a school himself, only I much question if he would like to throw himself into the breach and sacrifice his business prospects for the compensation usually given for such work, and that is

just where the rub comes in. There is no lack of the necessary brains both within the Society of American Florists and outside of it, but the trouble is that the owners of the brains would be likely to set too high an estimate on them.

It would be worth countless millions to this great continent if the government would lay out say six sections of not less than five hundred (500) acres each in places where as far as possible the different latitudes would be represented, and experiments in agriculture and horticulture be carried on in the broadest sense, to be presided over by men who have had actual working experience in these departments. The compensation should be such that the proper men could be procured, the position should be permanent, clear of all political entanglements, and no removal should be made unless for cause. The value to the country of such experiment stations, under proper management, can not be estimated. Unbiased testing of varieties of plants, of machinery, implements, fertilizers, and everything pertaining to the twin arts of agriculture and horticulture, would be a boon to thousands who are yet groping

in the dark and must for generations yet to come unless some such system can be inaugurated. The State Experiment Stations are a good beginning, but the paltry grant of \$15,000 a year is a mere bagatelle to what would be required for Government Experiment Stations.

It is sometimes questioned why government should be asked to assist agriculture more than any other department of industry. Should it ever be forgotten that the soil is the sole source from which we derive our existence? Let it become barren for but a few years and all life, animal and vegetable would cease to be, so then, just in proportion as we can make it produce most abundantly, so will be our national prosperity.

PETER HENDERSON.

Jersey City, Sept. 20, 1889.

A Curious Sport.

A calla, recently grown in the conservatory of Mr. J. Tailby, of Wellesley, Mass., furnishes an interesting confirmation of the present accepted theory that the parts of the flower, including the surrounding bracts, are modified leaves.

The flower presented nothing exceptional in appearance, but the blade of the leaf, by whose sheathing petiole the flower stalk was enclosed, almost rivaled the spathe, both in delicacy of structure and in the purity of the whiteness, while nearly one-half larger. The upper part of the petiole and the wings of the sheath were likewise nearly blanched.

When the scroll of the spathe was first unrolled the white leaf was so nearly in opposition as partially to enfold its base, thus giving the effect of a double spathe with edges opposed. A week later the peduncle had elongated and raised itself above the investing petiole, presenting the appearance represented in the accompanying photograph.

So great was the similarity of white leaf blade and true spathe that a casual observer would scarcely have distinguished between them.

SUSAN M. HALLOWELL, Professor Department of Botany, Wellesley College. Wellesley, Mass., June 8, 1889.

Linum Trygynum.

I use the old name, for in most places they know no other, only a very few plantmen would call it *Reinwardtia trygina* or *Macrolinum trygynum*, but I have often seen it called *Linum flavum*, by mistake undoubtedly, for the latter blooms only during the summer months, while *L. trygynum* is a good winter blooming plant bearing bright golden yellow funnel-shaped flowers an inch or over in diameter in great profusion, beginning about the middle of October and continuing well into March.

But in order to get good plants we have to take a little more pains than we do with the more common plants, because they are liable to grow up irregular and without any shape if left alone. They require frequent and judicious pinching during the summer or growing season. A light porous soil and good drainage is essential to their welfare. Cuttings made in April or May of the young growth will make good bushy plants for winter blooming if shifted on as they fill the pots with roots and the pinching back is not neglected. We repot the little plants soon after spring sales are over into 4-inch pots and plunge the pots up to the rims out doors in an open sunny situation, watering and syringing freely every day, for red spider is sure to come forward and take a hold if a spell of dry

weather should set in, and it would seriously injure the plants should they become infested with that pest. Again in August we report most of them into 5-inch pots and by September we stop pinching.

When danger of frost is apprehended we take them in and give a place near the glass. They love plenty of light and will flower profusely in a temperature of 50° or 60°. While in flower water overhead should be applied only on very bright days as the flower buds and flowers are liable to damp off if the water should adhere to them for any length of time, but the sight of such a plant in full bloom is ample reward for all the extra trouble and care we may have bestowed on them during the year.

The plants sell at sight and can be recommended as house plants, for they will continue flowering in a dwelling in light or sunny windows and rather like such an atmosphere. Instead of looking around for new things we should rather see what can be done with our old well known plants. Experiments with new things are not only expensive but very often we get disappointed after great pains and losing much valuable time with them.

Rochester, N. Y. JOHN B. KELLER.

Some New Begonias.

The past few years have seen the begonia family take a front place among popular plants. Much more attention is being given to indoor decoration by the American people each year, and it was quickly discovered that few other plants possess as many fine points for window and conservatory culture as these, the great diversity among them and the almost infinite variety adding much to their interest, while their easy management and general freedom from insects makes them doubly desirable.

In Europe the great number of elegant private conservatories created a great demand for them at once, and they early received very careful attention at the hands of several firms who have since become begonia specialists, and who have produced for us some of the most interesting varieties in the family.

Of all the later introductions few have awakened greater interest or become more widely known than *Diadema*. On the continent it has been crossed repeatedly with *Rex* and already from various sources we find catalogued some twenty sorts of these hybrids which are designated as *Rex Diadema*.

One of the best known of these hybrids is *Lesondii*, a very beautiful free growing kind, already quite generally distributed through this country.

Clementine, one of the newest, is destined to become as popular as *rubra* or *Weltoniensis*, for though not of the flowering section it is as easily grown as the commonest pot plant and is very ornamental, the leaves being of beautiful form and an odd shade of reddish brown combined with olive green and blotched with silver.

Mme. Allamagny is another very decided novelty, having all the general characteristics of the *Rex* in style of growth, stem and leaf texture as well as the peculiar coloring found in that section, a soft grayish green of hollow ribbed and edged with dark crimson; the shape of the leaf is shown in the cut.

M. Charat has also an elegantly formed leaf, beautifully pointed and notched and the color disposed in the most pleasing style: A wide margin shades from brownish plum color to soft green and on

BEGONIA CLEMENTINE.

this are laid, irregularly, circles of silver; the dark center, following the graceful outline of the leaf is crossed by reddish veins.

Adrien Schmitt, also shows a long pointed leaf, nicely notched and lobed and heavy hairy stem, in this variety the silvery blotches are arranged in five bands running lengthwise between the ribs and showing very effectively on the bright green ground; the leaf has an odd, zebra-like, appearance.

Mme. Rival represents a few of the *Diadema Rex* where the *Diadema* blood is shown principally in the upright growth and in the very smooth glossy texture of the leaf.

These five are not noticed as being especially novel in appearance but to give an idea of what is to be found in this class.

Among other Hybrid *Rex* produced by crossing with various ornamental-leaf sorts, *Lucy Closon* is already quite widely known: This is to be followed in the near future by the introduction of a still more marked advance in this line—the very brightest leaved *Rex* in existence it is said. In the meantime, we have among this year's novelties such fine sorts as *Mme. Chate*, *Monge*, *Regnault*, *Richard Tournepont*, *Siebold* and others of like distinctiveness, all of which have been produced by crossing *Rex* with ornamental sorts.

Taken as a group they are most remarkable and we doubt if any other year will give us so many valuable and distinct new varieties.

S. A. HILL.

Philadelphia Notes.

During the past summer the demand for good roses has been better than for several years past. A great many reasons have been advanced to account for this spurt of business, but the prevailing opinion is that the heavy and numerous rains which we had during the season, and which have caused this period in this section to be classed as one of the wettest summers on record, destroyed almost entirely outside plants, carnations, etc., from which we get our bulk of stock for the summer, and therefore the market has not been crowded and the demand has been nearly always equal to the supply. From present indications the prospects for a brisk fall trade are good.

They say competition is the life of trade, but there is always a danger of overdoing matters, and it is a fact not to be disputed that there are more roses being grown around Philadelphia this year than ever before; whether the demand will increase in the same proportion time alone can tell. At present we are passing through what may be called the annual September glut, which is al-

LEAF AND FLOWER OF BEGONIA SIEBOLD.

LEAF OF BEGONIA M. CHARRAT.

ways to be expected being the fruits of an abundant first crop with no extra outlet.

A short time ago I made a visit to some of the leading florists' establishments in this vicinity and made a few observations which I trust will prove of some interest to the many readers of the AM. FLORIST.

The extensive place of Mr. Edwin Lonsdale at Chestnut Hill was first visited, and here may be seen a very fine lot of palms suitable for commercial purposes, among which were *Latania borbonica* in 8-inch pots, *Kentias* and *Areca lutescens*, and some 800 *Pandanus utilis* in 6-inch pots. All of these were in good shape and were developing character. The last named, *Pandanus utilis*, is one of the most satisfactory house

plants we have, and if water is kept from the heart of the plant it will last a long time and keep in good shape too. Mr. Lonsdale is also growing quite a quantity of ferns, some of which are planted out to produce fronds for cutting during the winter. *Adiantum cuneatum* and *A. decorum* are the varieties I can recall, and of the latter quite a number were in 6-inch pots. Mr. Lonsdale has an enviable reputation as a grower of that superb rose, the American Beauty, and early in the season he had some planted in a solid bed and they have made a most gigantic growth, greater than I have ever seen before. Among the roses on trial are to be found *Mme. Hoste*, *Duchess of Albany* and *Wootton*; the

latter have made a vigorous growth and are the largest plants I have yet seen. Of *Cypripedium Lawrenceanum* some 500 are receiving particular attention. A lot of *cannas* were planted outside and made a grand display. It is strange that more of these plants are not grown by florists, as they are fine for decorative purposes, and they are among the easiest to grow. A handsome stone residence is being erected for Mr. Lonsdale, and that he may live long to enjoy it is the wish of his host of friends.

Mr. John Burton's establishment is in close proximity to his old friend and former partner's (Mr. Lonsdale), and was next visited. He also is growing palms, and the *Areca lutescens* are worthy of

special mention, as they are exceedingly fine. The new rose known as the "Dreer Rose" is receiving particular attention, occupying a whole house and will be forced early. All of Mr. Burton's roses are in fine condition, especially his hybrids.

Messrs. Craig & Bro.'s mammoth place in West Philadelphia was also visited. Mr. Craig has evidently great faith in the future of the new rose, Vooton, as he has a whole house 22x100 feet planted with this variety, and no rose on his place looks more promising, there not being the slightest sign of mildew, black spot or any other disease on any of the plants and everything betokens the great care which is being bestowed on them. Mme. Hoste occupies a table of 300 feet, while Mrs. Jno. Laing is accorded a whole house to itself and is expected to come in some time in February.

Quite a portion of one of the large houses is devoted to the new varieties which are on trial, and to show how uncertain this thing of trying new roses is, Mr. Craig remarked that if he got one good one out of the sixty varieties he would be satisfied. I noticed Bennett's Cleopatra, but if one is to judge from what has thus far been seen of it it will not be worth very much as it has a tendency to weak growth and mildews very readily. In the same house with the roses just mentioned are some White Perles and 600 Duchess of Albany. I did not see a bloom of the latter but in growth it is identical with the La France and Mr. Craig speaks of it in the highest terms.

Chrysanthemums for cut bloom take up considerable space, there being a table 4x100 feet of Mrs. Alpheus Hardy and a whole house of La Neige, which blooms in October and is perhaps the best early white chrysanthemum that we have for cut flowers. Palms are also grown in great numbers, there being no less than six large houses devoted to them alone. Orchids are not being neglected by any means and among the most noticeable are about 600 Cypripedium Lawrenceanum, nearly every plant showing a flower bud, and as the bloom is good say for three months they will come in nice for the holidays. One advantage of this variety is that it flowers on long stems and is said to bloom several times in the course of a year. C. Bellatulum is in bloom and is very pretty and distinct, but unfortunately the stems are too short to make it of much value for its cut flowers.

Another place of interest visited was that of Mr. George Anderson, on the Darby Road. He has been building again and now has another fine greenhouse added to his already large establishment. The house is 19x100 feet with glass 16x24 inches. Mr. Anderson is a firm believer in the use of rafters, having for the long roof in front 2x6, while at back 2x5 with angle irons $\frac{1}{4}$ x1 $\frac{1}{2}$ x1 $\frac{1}{2}$ about midway, which makes a much stiffer job than iron pipe, which is generally used for this purpose. The trouble with the latter is that it soon sags between the supports and then never gets back to its place again, and if wood was used for this purpose it would obstruct too much light and not look nearly so neat as the angle irons. Mrs. Jno. Laing and Brunner are planted in this new house and all of the roses are looking fine. The Gontiers which occupy a house 22x100 feet are a grand sight and the finest house of Gontiers I have yet seen.

Lansdowne, Pa. W. W. COLLES.

Seasonable Notes.

Where the best results are expected and hoped for from carnations it is important that they should be safely and carefully housed by this time. I have frequently noticed that carnations lifted and housed the first few days of September are much quicker and more satisfactory, every thing being equal, than those lifted later in the month. While the weather late in September is generally liable to be quite moist, which would seem to be favorable to their transplanting, I am still inclined to think that the greater warmth of its early days and nights are a most important offset to the increased moisture later on. My plants of Hinze's White, Silver Spray, Lamborn and other whites that were placed on the benches during the 2nd and 3rd days of September are now looking splendidly and are supplying me with a continuous crop of pure white flowers of the very finest description.

Last fall I expressed an opinion that perhaps I might not grow Hinze's White any more, but when I see what magnificent flowers they are now producing, and how pure white they are, I am not sure but it would be prudent to reconsider the matter.

For the benefit of readers of the FLORIST I will say that these plants of Hinze's White that are now giving me such thorough and unexpected satisfaction were grown from cuttings put in early last October, they were potted off and managed all through the winter and early spring for the express purpose of flowering throughout the summer in place of the very unreliable and transient asters; early in April they were planted in an ordinary six foot frame with a little thoroughly rotted cow manure and plenty of air slacked lime mixed in the soil; they were divided into three lots and stopped at intervals of twenty-one days to ensure a succession of flowers, in fact they were treated in every particular the same as a similar lot were treated the year previous, which began to flower about the middle of June and continued flowering all the summer.

But for some reason or other they acted very differently this summer, the forwardest did not begin to flower until the middle of July, the second lot later, and so on, which I attribute in a great measure to the very great difference in the two seasons. Last year during July and August less than five inches of rain fell in this section, while this year during the same period over sixteen inches fell—a precipitation unparalleled. At all events when September came in my Hinze's Whites had the appearance of just being ready to begin business; they were a solid mass of buds in all stages of development; so they were lifted and housed on the 3rd day of the month.

My other white carnations were lifted the day previous and the two days were as hot and dry as any days of the past summer, and although the earth was so light that when lifted it cracked and fell clean away from the roots I never observed the slightest tendency to wilt or go back among any of them. The same

may be said of my Portias, Buttercups, Grace Wilders, May Queens and other sorts that were lifted on the 10th–15th, all of which were lifted by having a spade placed under them, the plants drawn carefully out leaving the earth behind.

I see that some carnation growers advise earlier lifting than the time I mention, which I think may be good for cooler regions, but I think for this section where we are liable to have the hottest part of the year during the first half of September, followed soon after by a great decrease in temperature and considerable moisture, that the first few days of September is just about right. In these particulars, with the exception perhaps of the time, I fully indorse the practice of Mr. Thos. L. Brown, of Grandville, Mich., whose interesting article in the FLORIST of April 15 last is a whole history to intending carnation growers.

I feel however that I would like to ask Mr. Brown one or two questions regarding his method of pruning with which he concludes his article. Mr. Brown says he believes leaf pruning to be better than stem pruning, and that he cuts and nips off the tops of the young plants soon after they are boxed off and so on throughout the season, seldom pruning however later than July 1. Now I have always noticed that whenever the shoot of a carnation is cut with a knife or nipped off that the center pushes up, elongating itself, and after a while presenting the appearance of having been gnawed by rabbits, and the plants always seemed to me to be greatly weakened by the act. Have I understood Mr. Brown in this particular?

In my own practice I never allow a knife to touch a carnation except in making the cutting and one other case; it sometimes happens that after the carnations are planted out and before they have attained much size that the drought and heat of early summer causes them to throw up flowers, the stems of which have but little or no foliage, these as soon as observed are cut clean off down to the plant with a knife; in every other instance pruning is effected by pulling out the center of the shoot, this causes a circle of shoots to start up around the base of the young plant, and if this practice is continued at intervals throughout the season I find the result to be dwarf stocky plants that just sit on the ground without the smallest sign of a stem. (By the way, let me mention here that if a carnation intended for winter flowering has a stem long enough for the sun to burn its usefulness will be of short duration.)

By this method of occasionally drawing out the centers of the shoots as required my carnations have no perceptible stems, either in the field or when removed to the house. H. E. CHITTY.
Paterson, N. J., Sept. 18, 1889.

The Outlook for Carnations.

We have noticed nothing in the last few numbers of the FLORIST in regard to carnations, and now that the season is at hand for placing the plants in the beds, all growers will be anxious to know what the outlook is for the coming season. In what condition are the plants? Are they strong and healthy? Has the weather in the different localities been favorable to their growth? How does the number grown compare with previous years? What are the indications in regard to supply and demand for cut carnations, etc.?

With us carnation plants go into the

AN INEXPENSIVE BASKET

houses looking rather better than usual. We have devoted one house 20x95 to trying the new varieties which this year number about sixty obtained from various sources and some of which have not yet been placed upon the market. We are growing Silver Spray quite extensively and it promises to be one of the best varieties introduced for several years. Lamborn, Tidal Wave, Geneva, Jaquer Germania, Charmer, Delicata and many others are looking well, but it is too early for anything definite in regard to them yet.

J. G. H.
Grand Haven, Mich.

An Inexpensive Basket.

We have used a great many baskets of this shape; the handle is very well adapted for showy decoration. In this case we used larkspur to good advantage. The basket is oblong and can be filled with comparatively few flowers. In arranging these flowers no wires were used except two or three pieces to attach them to the handle.

A good rule for young men to remember is, roses that have stiff heavy stems like hybrids should stand up and those that have delicate stems like most Niphetos some Mermets and La France should droop. Often do we see this rule reversed with the aid of wire, which detracts from the natural and artistic effect.

H. H. B.

The "Bruant Race" of Geraniums.

This section of the geranium family is awakening much interest among florists, from the fact that robust growing, free flowering varieties are an absolute necessity in the hot dry interior of our country if the geranium is to keep its place as our most popular summer bedding plant, and this fact is clearly recognized by the retail plantsmen.

Varieties that in the lake regions are the perfection of beauty in delicate shades or a mass of brilliant color in the scarlet, standing the blaze of the sun finely, in the section next south of this are a total failure, owing to the entire absence of moisture in the air for long periods of time. If a geranium can be found that proves a fine bedder in the latitude of Cincinnati or Louisville, it will succeed in any section, for nowhere in our country are the summers more trying on bedding plants.

It is believed that such a geranium has been found in what Monsieur Bruant is pleased to style the "Bruant Race." The variety Bruant was distributed in 1885, and by 1888 he had collected and classified under the head of "Race Bruant" no less than 32 sorts of this distinctive type, some twenty of them being of his own raising, the others originating with such men as Delaux and Boucharlart, and extending back over some ten years of time; singularly enough *Heteranthe* does not

appear in this distinguished company, although distributed by Lemoine in 1877 (having been raised by Boutard), and so similar to Bruant that they have been frequently pronounced identical.

In 1888 one hundred plants of each of these two varieties were grown in an oblong bed, the only difference discoverable being that Bruant was slightly the dwarfier and a shade deeper in color; in freedom of bloom and in habit there was no difference, and only a careful observer would have noted two varieties in the bed. Any florist having either Bruant or *Heteranthe* has before him a good type of the "Bruant Race;" of course if he have "Double Gen. Grant" he has also the type as that is conceded to be *Heteranthe* renamed; by whom? is an interesting and an open question. Those unacquainted with these two sorts will find many of their characteristics in the old original double scarlet varieties; a broad short leaf, often 5x4 inches, of heavy texture, strong stocky stems and leaf stalks and abundant vigorous growth.

The hybridizers have improved upon these discarded varieties, giving us shorter joints, a finer leaf texture, in some cases a rudimentary zone, great freedom of bloom, a compact habit, while retaining all the sturdy vigor found in the originals. And this is their distinctive point; the strong, heavy growth and iron constitution which carry them brilliantly through our trying hot weather, a mass of cool bright foliage overcrowned by a magnificent show of bloom on tall heavy footstalks.

New colors are not claimed as yet by any of the race, though there is no telling what Mr. Bruant or his confreres may be able to do for them in this line in the future, but in the colors represented by them they are unsurpassed for clearness and softness of shade; as yet reds and scarlets are the prevailing tints, although a departure has been made and we have two or three more than ordinarily good pinks and several magnificent salmons which are unsurpassed in the entire geranium family. As to the size of the bloom it is in proportion with the fine growth of the plant; nearly every variety carries a grand sized truss; the florets are borne on long pedicels which prevents their crowding; two sorts carry unusually large flowers, the florets by actual measurement being 2½ inches long by 2 inches wide, of almost pansy form; other varieties average about 1½x1½ inches; the florets are circular in only a very few sorts, the majority show a slight separation between the two upper and three lower petals, many of them being similar to the finer varieties of ivy geraniums in form; in all the single varieties the three lower petals are beautifully concave or shell shaped.

And this brings us to another distinctive feature; only three or four sorts show any departure from the single form; *Heteranthe*, Bruant and Dr. Thouvenot generally show enough petals to be classed among the semi doubles, though frequently coming single; several varieties carry six petals evenly arranged, giving the flower a beautifully rounded, finished appearance, and the single flowers are noticeable for holding their petals finely when cut, quite as well as the ordinary semi-double.

It goes without saying that geraniums of this class beside being unequalled as bedders make extra fine pot plants also, and doubtless the next few years will add to their ranks "fancy" sorts as finely colored and marvelously tinted as *Gloire de France*, *L'Immortelle* or *Poete Na-*

tionale of the ordinary type, while M. Alfred Mame and Mrs. E. G. Hill will, we think, never be surpassed in their particular line. Already quite an extended list of "Bruants" are found catalogued, and below the color of a few of the most noticeable is indicated:

Dr. Thouvenot, semi-double—soft rosy scarlet.

J. Chretien—rosy carmine shading to soft scarlet.

Le Cid—A shade nearer scarlet than J. Chretien, flonet circular.

Georges Ohnet—Brilliant scarlet.

Barbiset—Two upper petals white for half their length shading into Hermosa pink which is the general color.

M. Noury—Very beautiful rose color with tinge of lilac.

Del Rosso—Magnificent salmon, white center, shading to light lines about the center.

M. Alfred Mame (2½x2 inches)—Soft sub-scarlet, lower petals shading to salmon in the center, which is deeply veined crimson.

Francis Arago—Soft salmon pink shading to high tone of salmon in the center, beautiful glistening texture.

Mrs. E. G. Hill (2½x2 inches)—The center of each petal is a soft light salmon bordered with rosy salmon and veined deep rose. Frequently throws six petals.

Leviathan—Brilliant red with touches of orange at the center; one of the very best in the series.

M. Emile Barre—Circular flowers of lovely vermilion shade, very pleasing.

Mme. Blanche Moulas—Large salmon flowers beautifully bordered with white.

S. A. HILL.

Propagating Geraniums.

The method followed at Lincoln Park, Chicago, by head gardener Stromback, is to take cuttings from bedded plants in latter part of September. The cuttings are pretty well trimmed and placed in the sand beds in the greenhouses, the sand having previously been well wet down. After being placed in the sand they are watered along the rows to settle the sand around them and no more water is given them for about ten days or until the cuttings are calloused, but in bright weather they are syringed occasionally if the foliage gives indication of wilting. But until the cuttings are calloused he aims to give them just as little water as possible and not very much more after that until bottom heat is supplied and more liberal waterings are necessary. He believes that more geranium cuttings are lost and injured from overwatering than from any other cause, especially in fall propagation.

That "Remarkable" Geranium.

In 1882 Mr. Thorpe in making up catalogue copy classified the geraniums into colors, and under the head of deep purple shaded flowers or in other words base of flowers red with deep purple shading—we find Remarkable along with Ernest Lauth which is nearly identical with it in color.

Remarkable is one of Mr. Thorpe's "chickens" which I remember very well from the seedling plant. It was sent out eight or nine years ago and the remarkable part is that with all the new varieties and improvements offered during these years there has not been one of the same shade to take its place.

W. P. SIMMONS & Co.

Diseased Asters.

The immediate cause of asters dying off as mentioned by F. A. D., is the work of an insect which is a bright dark green bodied fly about ⅜ of an inch long when perfect. The female punctures the stem and deposits an egg close to the ground line, the egg is hatched and the larva begins at once to eat and work its way up the center of the stem, sometimes for only an inch in height, oftener for two or three inches when it emerges. The plants so stricken generally die within three or four days. I believe this is the same insect which ruins the stems of chrysanthemums about the same season.

During the past season I have lost nearly one-third of my carnations in the open ground from a similar insect, though I believe it is not identical. I tried as a remedy tobacco dust and slug shot, but with indifferent success.

JOHN THORPE.

Seasonable Notes.

Buds will now be the desideratum of most growers it is presumed; to get these clean, bright and of good size it is necessary to keep the plants as clean as possible and all insects should be destroyed as soon as seen. Green fly will be one of the most troublesome at this season, and as burning the stems invariably destroys the color of the flowers it will be necessary to adopt some other means such as recommended by Mr. W. J. Palmer at the convention of the S. A. F. in Buffalo last August; where the pipes are made hot enough to evaporate the tobacco juice it is perhaps the simplest and easiest way to keep down this pest. Where such an appliance can not be used then resort must be had to some other means, such as laying stems through the walks, etc.; but the tobacco now contains something very obnoxious to plant life if it is allowed to come in direct contact with the roots, therefore it is not advisable to lay any stems directly on the soil; in the past we have found no difficulty in keeping the hoses clear of green fly by putting stems over the walks, changing the same about every six or seven weeks, but there are two objections to this method, first it keeps the house in an untidy looking state all the time, and the second is the expense, where the stems cost much it means a considerable sum for each year. We tried several experiments last season with the vapor system as recommended by the English and French growers, i. e., boil the stems till quite a strong liquid is produced, then evaporate the same in the greenhouse by slow boiling over a charcoal fire or lamp, but so far as we tried it did not find it a success, but hope to continue the same this season and possibly may learn how to do it right, should we do so will give your readers the benefit of it.

Where the plants in benches have made a fair start to grow a very thin mulching of well decomposed cow manure (not over half an inch thick) will help them and should be put on as soon as possible, particularly where the shallow bench system is followed. Some still think that

green cow manure is just as good or better than old material, but frequently we hear of some one who gets hit pretty hard by using it and then comes the old proverb: "Locking the stable door after the horse has been stolen," but my advice is keep it locked and barred tight all the time. Keep all dead leaves, weeds, etc., constantly picked off the plants and surface of the soil, and where the plants are not already tied lose no time in doing so, as it makes very considerable difference in the value of the crop whether the buds have long straight stems or crooked short ones. The latter are almost sure to be the result if the plants are not carefully tied up and the stems kept straight while growing and forming their buds.

JOHN N. MAY.

Rose Her Majesty.

Having noticed an inquiry or two lately in the FLORIST in regard to rose Her Majesty, I send you my experience with it.

I planted out two small pot plants of it three years ago. They grew finely—say five feet the first season—but did not bloom that year nor the next summer, though well headed in. Last fall I pruned to two canes each, left these nearly six feet long, laid them down and covered them. This spring I took the covering off and left them laying on the ground till eyes had well broken all along the canes, some of them showing buds. I drove a stake to each, tied them up, and they certainly well repaid me for the care bestowed on them. People would stop on the street and try to find out what they were. The flowers were immense and the color was if anything more like La France than the deeper pink it was represented to be.

One plant is now nine feet high and though it has some mildew and has not bloomed this fall I am satisfied that it will be on hand next spring.

Bloomington, Ill. F. A. BALLER.

To Keep Down Greenfly.

At the Buffalo convention Mr. W. J. Palmer described his method of keeping down greenfly without fumigating. He has found it very effective and free from the objections to fumigating. He places a liberal quantity of tobacco stems in a barrel and then fills it with water. After steeping for a day the tobacco liquor is evaporated in little troughs (see sketch) attached to the steam pipes. He fills these pans with the liquor about twice a week and has no trouble from greenfly. Larger troughs attached to hot water pipes answer the same purpose.

Rochester Notes.

BY WM. FALCONER.

On my way to Buffalo I stopped over a day at Rochester, a city of great horticultural interest, and at once made for

KIMBALL'S GREENHOUSES,

where George Savage is gardener.

Mr. Kimball is a very wealthy gentleman, a devoted horticulturist, a specialist in orchids and has one of the most valuable and complete collections of these floral jewels, not only in America, but in the world. "Kimball's greenhouses" are one of the sights of Rochester and are freely open to the public. They occupy a large block on the outskirts of the city, and are easily reached by horse cars which pass the door. Mr. Kimball's residence is some distance away from his greenhouses.

George Savage I have known well for nearly sixteen years. He is one of the best plantmen and orchidists in this country, and a universal favorite in Rochester. When George Such's great nurseries at South Amboy, N. J., were in their zenith Mr. Savage was propagator there for several years; then he went to Philadelphia, and to England, and back to South Amboy to the Rathbone greenhouses, and in a year or two succeeded Mr. Clements as the general manager of the great Such nurseries. When these nurseries were broken up Mr. Savage engaged with Mr. Kimball, and here he still is, honored and respected by everybody.

Glazed orchid pots were used in large and small sizes, in ordinary, pau and basket forms, for bench work and suspended from the roof, and Mr. S. tells me that orchids do just as well in them as they do in soft, porous pots, and they

around by Mr. Kimball's house—the finest mansion in Rochester. The gardener there was in great trouble. In a large bed filled with sub-tropical plants some playful street dogs the night before must have had a jolly good time, and in their romping broke many plants and scraped out a hole big enough to bury a sheep in.

ELLWANGER & BARRY'S NURSERIES

are one of the most noted on this continent, not only for fruit and ornamental trees and shrubs but also for roses and hardy herbaceous plants. Like most large nurseries of the kind large tracts of ground here and there and a good many miles apart are devoted to the growth of young trees, but the home nurseries are right in the border of the city and the horse cars run past the office door. The propagating houses and frames, the hardy plant department and

past for a sunflower and a favorite with those who know it.

The old fashioned Goldlocks (*Chrysosoma linosyris*) was a pleasant plant to run across. Here I found a bed of it in full bloom. It is a hardy perennial, native of Northern Europe and perfectly at home with us. Its flowers are yellow in terminal corymbs, and its stems and branches well clad with fine narrow leaves. It grows about fifteen inches high and is increased by division or from seed.

VICK'S

is one of the floral sights of Rochester. At the home grounds are the warehouses, greenhouses and experimental grounds; a mile or two away is a considerable acreage devoted to gladioluses, tigridias, tuberoses, small fruits and other stock; and seven miles distant is the seed farm, which then was one of the gayest sights that could well be imagined. Drummond phloxes, verbenas and China asters were in their very finest blooming condition; and there were also large tracts of dahlias, zonal pelargoniums and other florists' flowers. Acres upon acres in an unbroken mass were covered with these plants in full bloom. Considering how cheaply many of these seeds, Drummond phlox and zinnias for instance, can be purchased at wholesale rates in Europe, it seems strange that it would pay American seedsmen to grow their own seeds, but it does in this way—they are absolutely certain of the kind and quality of the seeds they have got.

Comet asters were finer than I ever before had seen them. The flower heads were immense, anemone quilled in the center and with broad flowing outer rays, and they well maintained their reputation of being among asters what the Japanese varieties are among chrysanthemums.

Triumph aster still needs selection; some are very fine and others poor enough. Being so dwarf doesn't help it any. In my opinion a far better aster is one they call Fire King, it is of much the same color, but larger and taller.

Burpee's White Queen aster is a splendid variety with very large, full double, pure white flowers, that are copiously borne on stout stalks. But although the plants are pretty dwarf they have none of the stiff bunchy appearance of ordinary dwarf asters. I, myself, have grown it for two years and unhesitatingly recommend it.

The dwarf zinnia is a forlorn little wretch. It is dwarf enough and the flowers are stuck close into the little bushes, but the plants are of irregular size and a large number of them have poor, watery flowers. I grow it myself and my own plants of it are as miserable as anybody's. But with long and careful selection and isolation I am confident we can obtain a strain of dwarf zinnias of even size and habit, and having full double brilliant blossoms.

Miniature sunflowers were grown and a stout variety has been added to the list, but in my opinion it partakes a good deal of the coarseness of *H. lenticularis* and is not as desirable as the pure "miniature" which is the true *H. cucumerifolius*. It is a capital decorative plant. From seed sown in April and June I have it in bloom all summer long. I also found *H. Maximilianus* being raised from seed. This perennial species is somewhat scarce in cultivation, and is considered a little tender much north of New York. But it thrives splendidly with us on Long Island and where it blooms about the last of

TROUGH FOR EVAPORATING TOBACCO LIQUOR

have a great advantage over ordinary flower pots in never getting green and dirty.

The water lily house is one of the features of the place. It is about 80 feet long by 22 feet wide, and in the middle is the water tank which is about 60 feet long by 16 feet wide and 4 feet deep in the middle and grading to 2 feet deep at the ends. The Victoria regia used to be grown in this tank, and it grew and flowered well, but it fell into disrepute on account of the vast amount of room it occupied and the short space of time it lasted in bloom. It used to crush the nymphæas clear off of the pond, then as there was no room for both it became a question which one of the two should be retained, and the nymphæas were chosen. These are in bloom all summer long. There are day bloomers and night bloomers, white, blue, rose, purple and red species and varieties. Among the most vigorous were *N. Zanzibarensis* rosea, *N. Z. azirea*, *N. rubra*, *N. Devonensis*, *N. dentata*, *N. cœrulea* and *N. stielata*. Mr. Savage lifts and replants them every year. For soil he uses good, rich, fibrous loam and plenty rotted barn yard manure with a good layer of clean sand on top to purify the water and prevent muddiness. *Nelumbium speciosum* is well established at one end of the tank and so obtrusive had it become that a 4-inch brick wall had to be built in the tank to separate it from the nymphæa quarters. Aphides are quite bothersome on the water lilies, especially on the stems of the *Nelumbiums*, and it takes a couple of good doses of tobacco smoke at a time to dislodge them. One end of the house was decorated by a mass of palms and other fine foliage plants, and the other by a thicket of vines in bloom, for instance, allamanda, bougainvillea and *Aristolochia elegans*. This *Aristolochia* was beautiful and very copious. As a pot plant, Mr. Savage tells me, it never attains the vigor that it does when planted out.

No fences, no flower beds; we called

the specimen and stock plants of ornamental and fruit trees are all contained in the home nurseries.

The propagating frames are within a hedge enclosed square and consist of ordinary cold frames, with a muslin shading supported over them and some four feet or more above them. Cuttings of many shrubs and roses were rooting in the sand in the sash-covered frames.

A large bed of delphiniums in full bloom was one of the gayest sights in the nurseries. Our delphiniums on Long Island were past long ago; evidently these were young stock raised from seed last winter or spring and afterwards planted out. And they find as I and some others find that we can raise as good a strain of delphiniums here as we can import from France, providing we exercise careful selection and crossing.

Of phloxes in bloom there was a very fine display, masses upon masses of the various sorts were grown in the long borders on either side of the broad grass walk, so that we were able to see and distinguish the varieties from a distance as well as near at hand. Among the red eyed ones Richard Wallace was fine; Lothair, Isaby, Mme. Kamper and Oberon among the reds, and Parrai, rose, were also strikingly distinct. The plants in bloom were of last winter's propagation and set out in spring.

Rudbeckia speciosa (Neumanii) was in full bloom and the brightest and best of all seasonable yellow flowering hardy perennials. It grows two to three feet high from a compact tuft of leaves, is neat and without any of the coarseness or straggling habit of some of the other members of the genus, and a stock of it is easily gotten up from seed.

Helianthus rigidus was grown in mass and it was in full bloom. It is a hardy perennial, three to four feet high when in bloom, and bears moderately large, bright, golden yellow flowers. Although it grows wild in the Atlantic States it is not common in gardens, but it should be, for it is a neat and showy plant, com-

September and first of October, and we consider it one of the finest of all sun-flowers.

Amaranthus Henderi, upright and pyramidal in habit, with crimson foliage and branches tipped with variously colored fiery foliage was conspicuous as one of the most brilliant of all the showy race. And what a contrast from the host of weedy wretches of love-lies-bleeding and prince's feather *Amaranthuses* that nowadays are included in flower novelties. Indeed this rubbish is enough to alienate stout hearts from the whole family.

Plum purple fruited peppers are, I should think, to be one of the novelties we may be treated to next year. I found it at Vick's, and I came upon it in other places too. The plant is a very moderate grower, with somewhat violet purple flowers, much resembling those of a solanum, and the fruits are cayenne pepper shaped, plum or violet purple in color and only moderately biting to the taste. Good enough as a transient novelty, but I don't think it will ever hold a permanent place either among culinary or ornamental plants.

Of the old shell flowers or *Molucca balm* (*Moluccella laevis*) I observed a large patch in full bloom. This is a very interesting annual from Syria, and one that was in common cultivation in gardens long before I was born. It is a neat, odd appearing plant, but not at all showy, and it has an "herb" fragrance. Its dense whorls of large, open, shell-like calyces which are green and much netted veined are its main attraction. A few years ago the *Rural New Yorker* advertised and distributed it widely among its subscribers.

BATAVIA

is a station between Rochester and Buffalo, and is remarkable for its beautiful garden. Right alongside of the railroad track is a long narrow strip of lawn as fresh and smooth and dense and well mown as that in any private garden in town, and in it are cut out a series of flower beds that are as neatly and well and tastefully filled as those of any professional florist could be. Railroad stations are gloomy enough, and any tasteful decoration of this sort is admired and appreciated by the traveling public, and a delightful memory.

Palms and Like Decorative Plants.

BY ALFRED E. WHITTLE.

No aspect of the development of our business in this country is more noticeable than the growing and selling of palms, ferns and other decorative stove and greenhouse plants.

This development is substantial ground for believing the wealthier classes of our large cities are becoming so accustomed to the adornment of the home with fine plants—not only upon festive occasions, but as a part of every day life—that this expense is not looked upon so much as a luxury as a necessity. Even in the smaller towns and villages—where formerly not a cent would ever be expended upon any such object—it is now considered quite an essential part for wealth, to decorate with plants at weddings and balls.

To meet then, this growing demand—not only to meet it, but to encourage it, and in some instances to create it—increasing numbers of palms, etc. are being grown and distributed all over the country. Plants of this class grown in the States must have increased during the past ten years more than 100 per cent. As statistics have never been kept

upon this interesting increase accurate data to base assertions upon can not be obtained, but observation should certainly verify the above statement. When one witnesses the thousands and thousands of palms and ferns that are grown in such profusion in the larger establishments it is a matter of wonder where they all go to, and for what purposes so many can be used.

Another feature of this trade in decorative plants is the increasing use of palms and other large ornamental foliage plants for the decoration of the lawn and flower garden in summer. A bed of this nature seen this year at Saratoga, prepared by Mr. Totten, is somewhat of a revelation as to the possibilities of this method of decoration. This is an immense head—oval in shape—filled with large and medium sized palms, pandanus, dracaenas, crotons, ferns, etc. The effect is most striking, and in the writer's opinion far surpasses in an artistic point of view, the unnatural results of carpet bedding. This instance is mentioned as an illustration of what may yet come. For, if such bedding ever becomes general a great increase in the demand might certainly be expected, and it is to be hoped that there will be systematic efforts to encourage their extended use for this purpose. The plants receive no harm, for they not only make growth but become hardened for winter work.

Among the many large establishments where palms, etc. are grown in considerable quantities, the one owned by Siebrecht & Wadley, of New Rochelle, N. Y., ranks with the best for system, size and the general welfare of the plants belonging to it. The houses are built substantially, evidently for the object for which they now are used. One large house for specimen palms is especially noticeable for its size and solidity of construction. Considerable money has been expended of late years in improving the grounds and the buildings erected upon them, for the purpose is to be ever on the alert to increase the total efficiency.

The houses are heated by hot water, but it is Mr. Siebrecht's intention to try the changing of his present system to heating by steam, retaining, however, the 4-inch cast iron pipes formerly used. Under the low pressure system of steam heating such pipes can be used, but they must be laid with care, so that all the water may be returned to the boiler without meeting any obstruction on its way. If Mr. Siebrecht carries out his plan and can arrange these pipes so that there will be perfect circulation, it will be interesting to know his experience, for there is no doubt many would change from hot water to steam could the old pipes be utilized and one item of expense be thus reduced. The writer can testify that 4 inch cast iron pipes will answer for the circulation of low pressure steam, as some houses formerly under his charge were heated with such pipes, but owing to defective arrangement, the result of inexperience, they were not entirely satisfactory.

One peculiarity of the present system of raising and growing palms, as practiced here, and which has before been incidentally alluded to in these pages, bids fair—if present success is any criterion—to completely revolutionize existing methods. The allusion is to the undertaking so lately commenced, a nursery for palm raising at Trinidad, and when a salable size is attained forwarding these palms in large quantities to the greenhouses at New Rochelle. Mr. Siebrecht speaks in the most enthusiastic

terms of the probable future success, and well he may do so, to judge by a lot of specimen plants of *Areca lutescens* which have but lately arrived from this island. Magnificent plants these are, without exception the finest at present in the market.

It has been customary with some growers, in order to quickly raise large plants of this palm, to place when potted, one large plant in the center of the pot, with two or three smaller ones around it. As these grow they fill up rapidly, thus becoming much more bushy than by growing a specimen from a single plant. These areas from Trinidad have the appearance of a dozen plants placed in one pot, and such were they supposed to be by the writer, until informed that each specimen was only one plant, but which had thrown up suckers in such wonderful profusion. The growth of them all, too, was so symmetrical and graceful, quite unlike the plants of *lutescens* that are generally seen. If such specimens can be grown from small plants in two or three years, a striking evidence is at hand proving that the market will eventually be governed by the stock of this tropical nursery.

Another palm, *Rhapis flabelliformis*, which at present commands somewhat high prices on account of the time it takes to bring it to a decorative size, can also be grown on this island quickly and in quantity. *Kentias* also are at home and many thousands are being prepared for this market. *Pandanus Veitchii* is another plant which is always in demand, and of which there is never sufficient stock to supply all needs. The future, however, will witness a very large increase in the number that can be purchased, for at Trinidad they grow like weeds, furnishing the propagator with an unlimited supply of suckers.

When this system is perfected and seeds are freely produced from palms left for that purpose, thus guarding from loss that would arise from unripened and imperfect seed, the only limit to the number of palms raised and marketed will be the condition of that market. The shipping for the care of these plants in transit is not yet all that is desired, but it was stated that new steamers will soon be launched, built for the Trinidad trade, and which have been designed with the view of ample and proper accommodation for whatever plants may be on board during the voyage. Even if, under these conditions, there should still be part failure experience teaches us that the inventive mind of man will eventually overcome all obstacles of this nature.

As there are fully 2,000 *Pandanus Veitchii*, nice, salable plants, now in the greenhouses, some idea may be gained of the way that stock will increase as soon as existing methods are improved. A fine lot also of dracaenas and crotons, the quality of the plants being very creditable to the grower.

Among the palms which Mr. Siebrecht pointed out as quite desirable for decorative purposes two or three may be especially noted on account of their graceful appearance, and because they are strongly recommended for their hardy natures. These are *Thrinax parviflorum*, *Martinezia caryotafolia* and *Caryota sobolifera*. The latter species instanced as being superior to *C. urens*. There are many handsome specimens in the large palm house, the largest of their kind in the country, and it is a marvel how such immense plants can ever be taken to New York for use in decoration in the

cold of winter, and yet brought back not seriously injured.

Rose Hill Nurseries have long been noted for the large collection of orchids grown there. All are looking well, and for a commercial place, very well. They all show the care that has been spent upon them; though grown in such large quantities very few poor plants can be seen. For another instance of the quantities handled it may be mentioned that on the benches are over 2,000 *Yucca Skinnerii*. One may well say, "Where do they all go to?" Yet the fact was stated that not an orchid flower has been wasted.

Some cattleyas in flower were of fine form, especially *Loddigesii* and *superba*. Summer blooming cattleyas are not always considered desirable, but their flowers can be used to advantage though they do appear when the demand is generally light. The pretty free flowering *Miltonia spectabilis* was in good condition, and its large, showy blossoms made quite a display. Quite a collection of stauheas were noted, and as Mr. Siebrecht can succeed in keeping the flowers fresh when cut for a week or ten days they prove very useful to him. No better *oncidium* can be found for florists' work than *varicosum*. It flowers frequently and the blooms are so satisfactory. One of the most noticeable of the orchids in bloom at Rose Hill.

Other orchids worthy of remark were some exceedingly fine plants of *Dendrobium Dearii*. Seldom is this dendrobium seen in such excellent condition, and it is gratifying that it can be so, for the flowers have so many good qualities to recommend them to our favor. Also large numbers of *Cypripedium Spicarium*, *Vanda teres* and *Odontoglossum vexillarium*, all in good growing condition. *Phalenopsis*, that are always difficult to grow, were in vigorous health and well established.

Among the many ferns grown here *Adiantum Farleyense* finds a conspicuous place. A beautiful lot of well grown, marketable plants. A *pteris* called *Mayii* seems desirable, *Nephrolepis davallioides* is also another fern that is evidently an acquisition.

A feature of the management is especially deserving of notice and commendation. It is usually the case for owners to consider that all responsibility ceases towards employees when their wages are promptly paid. Any concern as to their welfare out of business hours is not a subject for general consideration. But in this establishment some thought regarding a higher standard in the treatment of the workmen is evident. A pleasant room is set apart for the men, to be used for the purposes of reading and writing. Some of the gardening periodicals are furnished. It is the intention in the future to develop this idea, and by degrees to gather a professional library. This idea is well worthy of thought. The more thoughtful the workman the better the work. It is to the pecuniary advantage of the employer to expend some money in providing food for the minds of his men. Too little is done in this direction; less in this country than in England. We all know what it was in our youthful days; with nothing of much moment to occupy the mind through the long winter evenings, pleasure naturally became the only object of leisure hours. A workman whose evenings are devoted to resting the body, but laboring energetically to cultivate his mind, is worth far more during the hours of labor than he who gives all his thought

to the indulgence of the pleasure-loving habits that are ever ready to allure the most of us.

There are so few opportunities available to the young men working in greenhouses for encouragement in study that when a step has been taken with this end in view, it certainly instills the hope that the purpose may not rest only in commencement, but that every effort will be put forth to establish a model library and study room. Much more might be said upon this topic, but further remarks in connection with this thought will be left for another paper.

Boston.

Benj. Grey has a magnificent house of *Pandanus Veitchii*.

The next meeting of the Gardeners' and Florists' Club will be devoted to a general discussion on "bulbs." This is quite a broad subject and there is no doubt the time will be well occupied.

Much disappointment is expressed among *chrysanthemum* admirers and others who like to visit their friends in other cities and to receive visits from them, because the *chrysanthemum* shows for Boston, Orange and Philadelphia have all been arranged for the same date. This looks like poor management. Can not something better be planned for next year?

Mr. Edwin Fewkes, a well known and much respected florist of Newton Highlands, died at his home on September 16. Mr. Fewkes was for many years a prominent member of the Mass. Hort. Society. He was a quiet, genial gentleman and had many friends. His son, Mr. A. H. Fewkes, is well known as a prominent *chrysanthemum* grower.

The cut flower market shows a slight gain, but fall trade seems to be unusually late in starting. The roses now coming into market show a decided improvement over the summer crop. Asters are not so plentiful and gladioluses and Japan lilies are about finished. Of carnations there are just about enough to supply daily demands. *Smilax* is rather overstocked. The demand for *adiantum* fronds seems to increase, but there is a large supply of first quality. The demand for lily of the valley and tuberose is very small as yet. Reports of *chrysanthemum* prospects vary very much, some promising fine displays, while others predict general or partial failure of the crop.

W. J. S.

ST. PAUL.—The lowest temperature recorded by the signal service here was 35° on September 18. But gladioli, dahlias, etc. have been frozen within the city and slight frost has been reported from other points in the state.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED.—By a lady to learn retail flower trade. Acquainted with bookkeeping. D. R. BERT, 955 Wentworth Ave., Englewood, Ill.

SITUATION WANTED.—By a first class gardener who speaks several languages. Best references. CARL GEHARDT, 1033 S. California Ave., Chicago.

SITUATION WANTED.—By a first class orchid grower. Experience in England, France and Germany. Good references. N. K. 74 Cypress St., Rochester, N. Y.

SITUATION WANTED.—By an experienced florist, private or commercial; age 39, single; States preferred. Reference. Address K, care Postoffice, Toronto, Canada.

SITUATION WANTED.—As gardener; single; age 32; thoroughly understands the business in all its branches. Can produce first class references from several of the leading families in England and Ireland. R. W. D., Newport post-office, Newport, R. I.

SITUATION WANTED.—By practical florist and gardener; second class rose, carnation and violet grower; now disengaged. Good references. Address: J. H. W., 110, Norwich, Conn.

SITUATION WANTED.—By a lady, at cut flower work; 8 years' experience in the work Johnston trade—now destroyed by flood. Address: EASY, Maple Line, Johnston, Pa.

SITUATION WANTED.—By a middle aged single German florist, good references and cut flower, with 10 years' experience in this country. Address: G. M., 74 Cypress St., Rochester, N. Y.

SITUATION WANTED.—By a florist from the 1st of November to the 1st of April. Practical experience in greenhouse and cut flower. Address: Box 55, Cape May City, New Jersey.

SITUATION WANTED.—By a Scotchman as gardener in the west, California preferred. Single; age 21. Private or commercial; good references given. Address: GEORGE ANDERSON, care Robt. Marshall, Swanhurst, Newport, R. I.

SITUATION WANTED.—By a single man as head gardener in commercial or private place. First class cut flower grower and planter; 16 years' experience; age 32; speaks English and French. Address: HANS SCHMALZ, care American Florist.

SITUATION WANTED.—Competent florist and gardener, experienced in all branches; open for engagement at once; private or commercial. Particulars given upon application. Address: J. K. KREMER, 100 Calumet St., Philadelphia.

SITUATION WANTED.—By a Swedish gardener, 25 years of age; single; 8 years' experience in orchids, palms, ferns, roses, propagating and general gardening. Exceptional and reliable references and testimonials from prominent European gardens and last employer in the state. N. JOHNSON, 47 Ridge St., Glens Falls, N. Y.

WANTED.—Ten horse power engine and pipes and everything complete for hot house 140 x 16. Send price, etc. to LEWIS K. KINNEY, Gloversville, New York.

WANTED.—A man who understands low pressure steam heating and is good at greenhouse work. Also a gardener who is well posted in all branches. Address: HENRY MOORE, 41 Beale Street, Memphis, Tenn.

WANTED.—By thoroughly practical florist, position as superintendent private or commercial place; good salary required; first rate references. Address with particulars: ALPHA, care American Florist.

WANTED.—A first class florist; a good propagator of roses, and one well up in the art of cut flower work. Will require first class reference. Will insure a good man a permanent situation. Address: A. GIDDINGS, Danville, Ill.

WANTED.—Experienced commercial florist as assistant foreman; married man preferred; one of executive ability, experienced in filling orders and capable of taking full charge of order and packing department is required. The applications of only first class men will be entertained who furnish good references. HENRY A. DREER, lock box 103, Philadelphia.

FOR SALE.—Two No. 15 Hitchings Boilers and 410 cast iron pipe. T. R. HOPKINS, St. John, N. B. Canada.

FOR SALE.—Five acres, two greenhouses 18 x 100, shed, stable, dwelling, etc.; all new; two miles from Denver. Our sunny climate is recommended for its healing qualities. Box 10, Montclair, Colorado.

FOR SALE.—200 feet 4-inch pipe, fittings such as tees, elbows, valves, etc., one new Ziegler boiler capable of heating 1,000 feet 4-inch pipe at very low price to close out. J. NEWMAN & SONS, 51 Tremont St., Boston, Mass.

FOR SALE.—Seven years established florist business, three greenhouses, 1/2 acre of ground on street car line, centrally located. The collection of plants; winter roses in 30,000 connections; but little competition; nursery in connection. Address: GEO. B. BOYAN, Pueblo, Colorado.

FOR SALE.—A good established florist business in a city of 100,000 inhabitants; 350 feet of glass, good stock greenhouse and bedding plants; city water; houses heated by steam; all in good repair; business paying well. Good reason for selling. MRS. GEO. LOW, Stillwater, Minnesota.

FOR SALE.—A rare chance for gardeners and florists. A well established and remunerative business, consisting of adjoining lots in city, with a good dwelling, barn, 2 greenhouses with hot water furnace, a good well and hydrant water supply, 5 acres well cultivated vegetable garden, within 1 mile from above mentioned premises, a large lot of choice plants, bulbs, trees, 1 1/2 horse wagons, water, sleigh, cultivation, saw, and other implements for sale at a bargain. Apply early to MRS. MAGALENE DINGER, Eau Claire, Wis.

FOR SALE.—Two Wilks heaters, second-hand, and good as new. One large size and one small one. Address: L. P. VOORHEES, box 413, Blue Island, Ill.

REQUEST.—Will the Secretaries of the various Clubs and Societies which contemplate holding a flower show this season please mail a premium list with rules and regulations, and address to C. B. WHITNALL, Milwaukee, Wis.

WHY IS it that many people have an idea that florists' flowers are a most expensive luxury which can be indulged in only by the very wealthy? Because they see frequent items in the daily press stating that "Jack roses are now \$2 each and other roses cost \$10 a dozen" and "at a recent wedding the florist received \$5,000 for the floral decorations," or "at the funeral of the Hon. ——— the flowers and designs supplied by ——— the florist alone cost \$2,000." Where do the reporters get these sensational items? In the majority of cases from the florist. Why does the florist add a cipher or so to the amount when giving such information? Because the one who is so indiscreet as to name figures received usually amounts to little and wants the public to be impressed with a sense of his importance and the immensity of the business he is doing. And what is the result? Many possible customers are deterred from becoming such because they can not afford a luxury so costly as flowers are supposed to be after reading such items. What is the best policy for the florist to pursue when a reporter calls? If it is along about the Holidays keep quiet about the "Jack" roses even if you do have a dozen or so that you hold at a high price, and tell him of the other flowers of which you have a good stock to sell at fair prices. And if at a season when flowers are plentiful, give him a bunch and tell him that handsome roses can now be had at from \$1 to \$3 a dozen. Tell him the facts as they exist, nothing which he can work into a sensational note on "Extravagant prices for flowers." And never be so unwise as to tell a reporter the price paid for designs or decorations. While there are some who may be pleased to have such items about themselves in the papers (especially if exaggerated), your best customers will consider your giving such information to the public as a breach of confidence and a piece of impertinence; and the loss of a good customer may be the result of your indiscretion.

EARLY FIRING.—The number of cut flower growers who fail to appreciate the importance of early firing is remarkably large. The cold nights we are now having are undoubtedly doing more damage to stock in houses which are not yet heated at such times than any other form of neglect. The saving of a little coal and labor by neglecting to fire on chilly nights at this time is the most penny wise and pound foolish move that a cut flower grower can make. The set-back stock receives from being chilled in this way cuts a big slice out of your crop of early bloom and it may take till spring for your plants to fully recover their vigor. For every dollar you save in fuel and labor now you will lose five or more in a shortened crop if the plants are chilled at this

time. Do as Mr. May advises, fire a little at night even if you have to leave the ventilators open a trifle. Don't over do it, but take every precaution against allowing your plants to be chilled now.

THE EXHIBITIONS.—At the coming shows do not fail to arrange with some competent and impartial person to devote his whole time to giving proper information to press representatives. After every exhibition there is more or less complaint regarding the press reports, and the errors and omissions complained of may nearly all be avoided if some competent person could always be found to give correct information. Remember that reporters for the daily press are nearly all quite unfamiliar with the plants and flowers exhibited and it is not surprising that their reports should be ridiculously incorrect when they are obliged to rely almost entirely on themselves. The active managers of exhibitions are usually too busy at the time to properly attend to the matter, hence our suggestion that some one be selected to devote his whole time to it; and all press representatives should be referred to him.

CATALOGUE ILLUSTRATIONS.—We respectfully submit to the Executive Committee the accompanying as an appropriate mark to be engraved on "cuts" which have been certified to be true to nature by a committee of the Society of American Florists. It could be made larger or smaller to suit the owner of the engraving, or to correspond with the size of the illustration. The year should be that in which the certificate is given and is we think essential. It would be well to have the name of the plant engraved on the block to provide against any possibility of error in the title. The mark should of course be copyrighted by the society that its improper use may be guarded against.

"CRAPE CHASERS" is a name which has been appropriately given to that class of men in the trade who have so lost all sense of decency as to force themselves and their fearfully and wonderfully constructed "original designs" upon the attention of bereaved people. These men watch the papers for death notices and then indulge in a race to see which shall first invade the privacy of the house of mourning with his album of photographs of "funeral designs." They are fortunately few in number and would be beneath contempt but for the fact that they bring discredit upon the whole trade through the publicity given their actions by the daily press.

WE ARE now in the midst of the annual hustle to get things under cover. The man with the half glazed house who is dawdling along a few weeks ago is now working like a beaver and hurrying things into the houses in most any shape. In no other business is it more important to do things at the right time. And in no other is it more common to allow work which could have been got out of the way before, to accumulate until the last minute and then be obliged to crowd work so that it is of necessity imperfectly and improperly done.

A NATIONAL PRIZE.—In the premium list of the Society of Indiana Florists for its coming chrysanthemum show there is offered by Mrs. Benj. Harrison a special premium of a silver cup for the best new seedling of American origin which is listed as "The National Prize." It would

seem eminently proper that now we have a National Chrysanthemum Society this "National Prize" should be awarded by it.

SEEDLING DAHLIAS.—Some very excellent blooms of seedling dahlias have been received from D. S. Heffron, Washington Heights, Ill. None were named. One handsome large flower of a rich crimson was most excellent and all were good. Some seedling cannas had dark red foliage of a deeper hue than any before noted.

PRESIDENT JORDAN urges the great importance of prompt remittance by every member of the S. A. F. of his yearly dues (\$3) to Secretary Stewart. The society can not continue its necessary and useful work unless the full quota pay their annual membership fee.

MEMBERS OF THE Florists' Hall Association who desire to increase their insurance under the amended by-laws, should address the secretary of the association and he will furnish the necessary blanks.

A SAMPLE of the fruit of Diospyros Kaki has been received from R. D. Hoyt, Bay View, Fla. He considers it the best seedless variety of the "Date Plum." We shall not attempt to describe the flavor.

Catalogues Received.

Jos. Breck & Sons, Boston, Mass., Dutch bulbs; Thos. Jackson, Portland, Me., nursery stock; Parker & Wood, Boston, Mass., bulbs and seeds; E. H. Krelage & Son, Haarlem, Holland, bulbs and plants; John Gardiner & Co., Philadelphia, Pa., bulbs; L. Green & Son, Perry, O., wholesale nursery stock; Lake Shore Nurseries, Erie, Pa., wholesale nursery stock; D. Lee, Madison, O., wholesale nursery stock; H. Cannel & Sons, Swanley, Kent, England, plants and bulbs; A. M. & J. B. Murdoch, Pittsburg, Pa., trees, plants and bulbs; John R. & A. Murdoch, Pittsburg, Pa., trees plants and bulbs; Henry A. Dreer, Philadelphia, Pa., plants and bulbs.

Coming Exhibitions.

Oct. 29-Nov. 8, Chicago.—Chrysanthemum Show Chicago Florist Club.
November 5-9, Indianapolis.—Chrysanthemum Show Society of Indiana Florists.
November 11-15, Detroit.—Chrysanthemum Show Detroit Florists.
November 12-16, Philadelphia.—Chrysanthemum Show Pennsylvania Hort. Society.
November 12-14, Boston.—Chrysanthemum Show Mass. Hort. Society.
November 12-14, Orange, N.J.—Chrysanthemum Show New Jersey Floricultural Society.
November 12-16, Cincinnati.—Chrysanthemum Show Cincinnati Florist Club.
November 13-14, Worcester, Mass.—Chrysanthemum Show Worcester County Hort. Society.
November 14-16, Springfield, Mass.—Chrysanthemum Show Hampden County Hort. Society.

LOUISVILLE, KY.—Francis Morat, Sons & Co., have just completed five 100 foot houses. Jacob Schulz has rebuilt two and added three new 70 foot houses. Mr. S. buds the new roses on American Beauty stocks and secures new wood rapidly. Nanz & Neuner's Pink Perle will not be sent out until 1891.

INDIANAPOLIS.—Trade has been unusually dull this summer, more people away from the city than ever. The following new firms have started into business: Chas. Wheatcraft, on 22nd street with a house 22x100; Bernie Fohl on 22nd street, with a house 26x104; Robert Miethke, in Mapleton suburb, with a house 22x100. Jens Larson has added a house 12x104 for carnations; Anthony Wiegand a cold house 20x150; Bertermann Bros. have given their place a general overhauling. A lively interest is being taken in the coming chrysanthemum show. Cut worms have done great damage in this neighborhood.

BUFFALO.—Henry Miller Long, brother of Daniel B. and Elias A. Long, of this city, died at his home in Williamsville, September 10.

BOSTON.—Up to September 23 the lowest temperature recorded this fall is 42°.

The Seed Trade.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. MCCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1890.

MR. CHAS. H. THOMPSON, seedsman, of Boston, was married September 18.

MR. C. CROPP, JR., with J. C. Vaughan, sails from Hamburg October 6 for home.

GENERAL REPORTS indicate that Dutch bulbs are in good demand and of good quality this season.

AN EXPERIMENT with onion sets frozen in cold storage is awaited with interest by the seed trade in the west.

A NUMBER of lots of English grown bulbs, as well as some French shipments, have been seriously delayed by the dock laborers' strike in London.

THE POTATO CROP in Northern New York is reported to be the worst failure known for many years, all varieties having blighted when the tubers were about half grown, making a very light yield and of inferior quality.

CONNECTICUT SEED GROWERS complain that low tariff and foreign competition is a source of much greater danger to them than that of the new seed districts in California or Nebraska, and intimate that the present low tariff will prove an exterminator to the seed growers in America, ordinary farming having paid better the past two years than seed growing.

GERMANY—BENARY'S HARVEST REPORT.—In spring it became apparent that the raw damp weather of last autumn, but more especially the sharp frosts in the early part of October, had considerably injured the whole of the Brassica tribe—cabbages, savoys, borecoles, kohlrabis and Swede turnips—and in consequence the crops of all will be very limited. The unfavorable weather just mentioned also had a serious effect on carrots. Parsleys and parsnips having also suffered during the winter, less was planted out than usual, but from the breadths growing fair crops may be expected. The almost abnormal heat of June and July was very beneficial to beans and the yield will be a good one, that of peas, spinach, endives and radishes of all kinds will be middling. Of lettuces and cucumbers we expect good crops and of salad beets and mangold wurzels the yield will be satisfactory. Onions looked very well in spring, but the subsequent unusually hot weather proved detrimental to their development and the result is only a middling yield of all varieties.

September 8, 1889.

Chicago.

Holland & Barrett have opened a floral store at 263 N. Clark street.

Around the city roses and violets are looking well, carnations fair.

W. D. Allen has bought out Jos. Krick at 65 State street and has removed to that location.

At Lincoln Park the gardeners are busy taking cuttings of all soft stock from bedded plants. These will furnish plants from which the main supply will be propagated later on.

On September 21 at South Park the mercury fell to 30°, but for a short time only. Coleus and other tender plants were damaged, especially those in low places where frost settled most.

Albert Fuchs has built eleven new houses corner of Evanston avenue and Sheridan Drive in Lake View. They are each 100 feet in length and from 20 to 27½ feet in width.

M. F. Gallagher the Wabash avenue florist is building three greenhouses near his residence at South Park station. They are each 75 feet long with widths of 16, 14 and 11 respectively. They will be used mainly for decorative plants.

The first frost occurred here last year on October 3, when the thermometer registered 33°, and the first hard freeze on October 20 when the thermometer dropped to 28°. September 20th the thermometer registered 36°, 13° lower than at any time by same date last year.

The water lily ponds at Lincoln Park have been a great attraction the past summer, so much so that it has been decided to considerably enlarge them for next season and to increase the number of plants. The two plants of Victoria regia have bloomed plentifully during the season, and though not covered in any way were apparently uninjured by the recent unusually cold nights, the thermometer dropping to 40° the night of September 18. The water in one of the ponds (that containing the victorias) is heated by steam pipes while the other has no artificial heat and the difference in growth of two plants of Nymphaea Devonensis—one in the heated and the other in the unheated pond—is very noticeable. That in the cold pond has made much less growth and the flowers are smaller in size and not so well colored as that in the heated pond, though the former was the strongest plant when placed in the pond. A plant of Nymphaea Zanzibarensis azurea in the cold pond has made a magnificent show all summer, bearing with remarkable freedom its immense blue blossoms. An excellent feature of the display has been that the name of each variety was indicated by a painted label which could be easily read by all visitors.

GRAND HAVEN, MICH.—Heavy frost September 22 killed all soft stuff outside.

ERIE, PA.—A chrysanthemum show will be held here in November.

MILDEW ON ROSES.

SING SING, N. Y., July 21, '89.

MR. BENJ. HAMMOND, Fishkill on Hudson.
My Dear Sir—During the past season, I gave you "Grape Dust" a thorough trial in my rose houses. As a preventive of Mildew on plants, I regard it as superior to sulphur. It is more easily applied, adheres to the foliage better and seems quicker in its effects. If mildew is caused by weakness or by an increase in the use of the plant or as is often the case in the winter months, by keeping the soil too wet, it is unreasonable to expect any permanent benefit from the application of mildew mixtures; but when caused by a draught of cold air, or by a sudden change in temperature or other unavoidable circumstances, it can be eradicated if taken in hand at once. For this purpose I know of no more efficient remedy than Grape Dust. I should think you would find a ready sale for it when its merits become generally known.

Very truly yours, JOHN HOAG.

P. O. Box 1400, SAN DIEGO, CAL.

ANNUAL REPORT OF THE FLORISTS' HAIL ASSOCIATION.**SECRETARY'S REPORT.**

After over two years of practical working, we are ready to assert, that to-day no more perfect system of insurance exists on the American Continent than that adopted by the Florists' Hail Association of America. One hundred and forty-two persons having banded themselves together for the purpose of securing themselves against loss by hail, find that after paying all losses and expenses except salary of the secretary for the past year and a small bill for printing) from June 1st, 1887, to August 12th, 1889, they have a fund of \$591.59 in hand. In addition to this membership fee has accumulated a reserve fund of \$743.07, after deducting \$76.25 which has been refunded to those who subscribed towards the guarantee fund and afterwards became members of the Association.

This result has been secured to members of the Florists' Hail Association by the payment of 6 cents per hundred square feet of double thick glass, and 8 cents per hundred square feet of single thick glass. The membership fee having been placed at interest, has this year brought to the assessment fund of the Association the sum of \$35, as will be seen by the Treasurer's report.

The total amount of glass now insured is 1,327,240 square feet, of which 734,386 square feet is double thick and 592,854 square feet is single thick. The total assessment is collected upon the same has been \$14 37, and the total membership fee \$89.32. No assessment other than that paid by members upon joining has been levied, and it still remains a question of the future how often it may be necessary to levy the same. The glass insured is located in twenty-two States and Winnipeg, Manitoba. The States of Georgia, Alabama and Dakota having been added to those reported last year.

The losses paid during the year were to W. T. Jackson of Larned, Kansas, for 29 square feet of double thick glass and 94 square feet of single thick glass, amounting to \$5 73; to S. G. Rife of Independence, Missouri, who lost 39 square feet of single thick glass, the sum of \$19.55; to Joseph W. Losey, president of Oak Grove Cemetery and greenhouses, \$4.73 for 174 square feet of single thick glass. To Robert S. Brown of Kansas City, Mo., \$49.95 for 35 square feet of double thick glass and 950 square feet of single thick glass. To Mrs. J. E. Patton of Great Bend, Kansas, \$15 for 30 square feet of single thick glass, and to Thomas H. Price of Lake Geneva, Wisconsin, the sum of \$65.13 for 859 square feet of double thick glass. Making a total \$160.00 paid for glass broken by hail during the past year. An effort on the part of your Secretary to locate the hail belt has met with the following result: So far as he has been able to learn hail has fallen during the past year in Elkhart, N. Y., Short Hills, N. Y., Spring Valley, N. Y., Chicago, Ill., St. Ignace, Mich., Peoria, Ill., New Hanover Co., North Carolina, Liberty, Mo., Larned, Kan., Monclair, N. J., Atlanta, Ga., Bell Co., Texas, Lake Forest, Ill., Danville, Virginia, La Crosse, Wisconsin, Independence, Mo., Morrison, Ill., Kansas City, Mo., City of Mexico, Mexico, Marion, Iowa, Abilene, Kan., Bonner Springs, Kan., Oconomowoc, Wis., Cedar Rapids, Iowa, Oswego,

N. Y., St. Albans, Vt., Martinsburgh, West Virginia, Great Bend, Kan., Montreal, Canada, Clinton, Iowa, Upper Sandusky, Ohio, Pembina, Dak., Lynn, Mass., Prairie du Chien, Wis., Lake Geneva, Wis. and Denver, Colo. From Montreal to Mexico, from Denver to St. Albans the florists' fickle structure is as liable to be crushed by hail as to be burned by fire.

In conclusion, the correspondence of the Secretary shows that the members of the Association are satisfied with the results attained. And such being the case, it is safe to announce that the Florists' Hail Association is no longer an experiment but an organization to which every florist who is careful to consult his best interests should belong, and with increased membership and strength, there is a field of future usefulness for this Association yet undeveloped and undreamed of. With the active co-operation of every member the officers and directors can accomplish much during the ensuing year.

J. C. ESLER, Secretary.

PROFITABLE ROSES FOR FLORISTS.

We have an exceptionally fine lot of Roses from the open ground that can be potted into 6, 7 and 8 inch pots. Florists will find them more profitable to grow than the ordinary field grown 4 and 5-inch pot roses. We only offer a few varieties, but all are the best market sorts.

Etoile de Lyon, La France, Hermosa, The Gem, Malmaison, Meteor,

The best Dark Red

Mme. Etienne or Dwarf Mermet; the BEST PINK for market.

Mme. Agathe Nabonnand, Rosy flesh; immense buds.

ORDER NOW. PRICE, \$12 per 100.

TERMS, Cash with the order.

ROBT. SCOTT & SON,

19th and Catharine Streets, PHILADELPHIA, PA.

E. Verdier fils aine, 37 Rue Clisson, PARIS, FRANCE,

Reminds his American patrons that he makes it his business to collect, every autumn, all the desirable continental NEW ROSES and to furnish them, in strong plants obtained from their producers. Some of these producers being slow in announcing the names and descriptions of their NOVELTIES, Mr. Verdier can but be late also, in reporting them in his descriptive price list—which shall be mailed, as soon as issued, to all applicants, by his Agent:

C. RAOUX, 296 Pearl Street, NEW YORK.

Philadelphia.

Up to September 24 the lowest the temperature has fallen in this immediate vicinity is 37°. Nothing out doors has suffered except coleus from the effects of the cold.

The excessive rains the past summer and fall have however wrought sad havoc among carnations and roses, one firm alone having lost 8,000 carnation plants outright, at least they are so badly crippled that they are not worth housing for the winter. Many florists who do a large trade in hardy roots will have very puny plants for next spring's sales.

Bouvardias have not suffered to any great extent hereabouts, but chrysanthemums that have been outside all summer present a sorry appearance in some quarters. Chrysanthemums deserve better treatment than some growers persist in giving them.

Roses in greenhouses for next winter's blooming are variable, some look better while others look worse than they did last year.

E. L.

OMAHA, NEB.—The Saline County Nursery Co., of Western Saline county, Neb., has been incorporated with a capital stock of \$15,000, the indebtedness being limited to two-thirds of the capital stock. Incorporators: D. J. Maynard, F. D. Maynard, A. A. Allan, F. H. Porter and N. H. Cowgill.

THE NEXT CONVENTION of the Association of American Cemetery Superintendents will be held at Boston on the same dates as that of the Society of American Florists.

W. S. HMMAND & CO., Carthage, N. Y.

St. Paul.

The Society of Minnesota Florists held its annual meeting September 12 and elected officers for the ensuing year as follows: E. Nagle, Minneapolis, president; Aug. S. Swanson, St. Paul, vice-president; Ernest Venzke, St. Paul, treasurer; Gust. Malmquist, Minneapolis, secretary. A change in the constitution and by-laws was made providing for semi-annual meetings instead of monthly. It is the intention to form local clubs in the larger cities which shall meet monthly. Minneapolis made a good start some time ago and we are waiting for St. Paul to follow.

The state fair had no interest to the florists this year, the premiums being too insignificant with the exception of one offered by a local clothing firm—\$50 in gold for floral design, which was awarded to Aug. S. Swanson.

The Minneapolis Florist Club is endeavoring to get up a chrysanthemum show this fall. St. Paul florists will help. Next year St. Paul proposes to have a show of its own.

THE AMERICAN FLORIST DIRECTORY.

THE AMERICAN FLORIST CO. WILL PUBLISH A NEW EDITION OF THEIR WELL KNOWN TRADE DIRECTORY OF THE UNITED STATES AND CANADA,

and propose to issue the same in time for spring trade of 1890. All persons in the trade who know of any changes from former Directory, either because of errors in that or of new places, are requested to send us the same.

We propose, where possible, to state amount of glass owned by each firm; and all who report to us are urged to state amount they have in round numbers that we may insert the same in the Directory.

PANSIES.

QUALITY HIGH.

PRICES LOW.

I attend personally to selecting the finest specimens only, for my seed bed, trying the various
 novelties and discarding those without special merit. Growing seed enough only to produce what
 plants I sell, I can make a finer selection than if grown in quantity.

From the sale of over 100,000 Plants last season I have received numerous
 recommendations. Not one complaint.

PRICES: Good stocky plants from seed beds, 75 cents per 100 free by mail, \$5.00 per
 1000 per express. Send for circular.

ALBERT M. HERR, Lock Box 338, Lancaster, Pa.

My Pansies are all from my own Seed Stock which I selected with most scrupulous care as to size and
 coloring. The varieties are in the proportion as indicated by the figures.

TRIMARDEAU	5	STRIPED	1
FANCIES	5	BLUE	1
BEGNOT	2	LIGHT	1
SE-PLUS ULTRA	1	BOPE	1
GIANT SHOW	2	DARK SELES	1
ROYAL DREERS	2	RED, Fine	2

In complete mixture 60 cents per 100; \$5.00 per 1000. If by mail add 60 cents per 1000.

DANIEL K. HERR, Lancaster, Pa.

REMEMBER—The seed I use equals any of the high priced or fancy strains, and is in more variety.

REMOVAL.

Friends will please notice that I have occupied my new
 printing house, which is ideally situated and fitted up for
 HORTICULTURAL PRINTING, with treble my former
 facilities, and plenty of room for extension. I am now ready to give better satisfac-
 tion than ever on Catalogues or any printing for florists, from the basis of a thorough
 knowledge of both flowers and printing. ADDRESS NOW

J. HORACE MCFARLAND, Mount Pleasant, Harrisburg, Pa.

Reduced Express Rates on Nursery Stock.

Hon. S. M. Emery, Chairman of the committee appointed by the American Association of Nurserymen for the purpose of securing lower rates on Express lines, reports to Secretary Chas. A. Green that a new classification has been agreed upon which amounts to a reduction of 20 to 25 per cent on all Express lines on all shipments of trees and shrubs boxed or baled. Such packages are now classed with produce.

THE VICTORIA REGIA.—In a communication to the Philadelphia *Ledger*, Mr. John Pollock, a florist of Frankford, states that he flowered the Victoria regia in the open air 30 years ago in the garden of the late James Dandas.

DECORATIVE PLANTS

Art (?) and Nature.

A copy of the fourth supplement to Mr. A. Blanc's catalogue of electrotypes containing prints of a large number of new engravings has been received. On page 67 appears the following: "A CARD:—I wish to say to my customers and to the trade in general, that I am opposed to making EXAGGERATED CUTS of horticultural subjects, and that such cuts are never made by me unless especially ordered. I would much rather engrave direct from photos or drawings true to nature. We have now reached a stage where nature can not possibly compete with art (?) in producing large crops—vegetables, specimen plants, etc.; and it places competing customers, as well as myself, at a great disadvantage, besides lowering the standard of the horticultural trade in this country. The evil has indeed become so great, that I have been obliged to refuse such orders at a pecuniary sacrifice."

Florists' Letters.

Emblems, Monograms, Etc. These letters and designs are made of the best Immortelles, wired on wood or metal frames, having holes drilled in them to insert tooth-picks, by which they are fastened to the design. Give them a trial. You will find these goods to be Superior to any in the market. PAT'D AUG. 6 1889.

NOTE.—All infringers or imitators of the above letters and designs will be prosecuted to the fullest extent.

Send for Sample.

WE ARE ADVISED by Secretary Stewart that the fifth annual report of the S. A. F., giving a full report of the Buffalo convention is ready and will be mailed to all members who have paid their dues for this year. Delinquent members should forward their dues for the current year (\$3) at once so that they may receive the report.

AT BUFFALO a Montreal florist expressed the hope that the Society of American Florists would at no distant day hold a convention in the city from which he hailed. This is certainly worth considering. There can be no doubt that holding a meeting on Canadian soil would have the effect of arousing more enthusiasm in the work of the society among our northern neighbors and bring them into closer relations with a society which recognizes no political divisions of its field of labor—the North American continent.

Education.

BY ALFRED E. WHITTLE.

Whenever any progress has been made in art, science or education the perception of the need was not confined to one mind, but was shared by many who, apparently, were all aroused at the same time to strive for a similar purpose. A like effect may now be observed in this matter of education that is agitating the minds of so many of our leading florists.

That this matter is a vital need is shown by the conspicuous place given to it in the addresses of the presidents of the S. A. F., and also by the notice taken of the subject by the executive committees of the last two years—essays considering this topic having been selected as part of the programme for the last two meetings of the society.

It will be generally conceded by nearly all of our number that education is desirable, not only for a few but for the many; and that there is no profession or business which numbers so many uneducated men in its ranks as this one of ours. For many years gardeners have been content to have this so, not understanding the benefits education confers. They neither wished it for themselves nor desired it for others. But earnest men of the horticultural world of to-day can no longer be satisfied to see all other professions surpassing them in mental culture and scientific attainment. The writer can see no reason why a gardener should not be a man of considerable information, able to observe and to investigate, competent to hold his own in any society. He utterly fails to perceive why any man of advanced education should be less practical or lose any of his mechanical ability.

So many are imbued with the idea that practice and theory can not go together—that if a man is educated beyond the common he at once becomes unfitted for all manual labor. The fact that this idea is so widely prevalent does not prove its truth. Some of the most erroneous notions are those that are most generally entertained. And certainly no greater error exists than this: That because a man is taught the value of knowledge and is trained to apply his knowledge to the improvement of his business, or his profession, he thereby becomes unfitted for all manual labor. This is a fallacy that surely must be apparent to all earnest thinkers.

It is an old aphorism that "Knowledge is power." If knowledge is power in any other undertaking in life it is equally so in horticulture. Only by knowledge, or rather, by the application of our knowledge are we able to unlock the secrets of nature, whose humble disciples we are. It is contended that men can be just as good gardeners irrespective of any education whatever. We will grant that there are exceptions—that some uneducated

men are just as good cultivators—that to be a good cultivator it is not absolutely necessary for a man to be educated other than by the education of observation.

Such a man is not a gardener—he is called one, but his capacity is very limited—usually mechanical and not progressive. Let such a man who, despite innumerable obstacles, attains to so much skill receive the training of an advanced education, and is there any one who will refuse to concede that his capacity must surely be enlarged? Why should it be thought that education will impede mechanical skill? That when a man loves plants and flowers—his whole soul absorbed in them—a knowledge of the sciences which treats of them will destroy his efficiency as a workman. If an educated man is an idler, or despises labor, the fault is not in the education he has received, but in the lack of a proper and systematic training. Usually the more a man knows the more he wishes to know. The harder he works the more he wishes to work.

We may then safely assume that the greater number of gardeners of the present day are quite satisfied as to the necessity of more thorough knowledge among us. That it is the part of the progressive men of our profession to think of what is needed and to seek to establish some way by which a scientific education may be made available for all desiring it. Agitation which ends in inaction is of no benefit whatever. Discussion that effects no improvement is merely a waste of words. The question has been agitated, we have had discussion, let those of us who are so interested in this subject take heed that this movement does not end in words.

Various ideas suggest themselves to various minds. An excellent method of education was adopted by Mr. Peter Henderson at the New York meeting of the society, and it must be gratifying to that gentleman and to all who seek for mental development to notice so many competitors for the \$100 premium offered for the best herbarium. What greater good can the society do than by offering each year premiums of a similar nature? The work entailed in gathering native plants for an herbarium is education—education of the very best kind.

The last president of the society suggested that public exhibitions educate, and that much could be done to promote taste and skill by advocating their extension. As to this, all will be agreed. Still as they are managed at present the premiums offered at most of our public exhibitions are not inducements for study by which the mind may be developed as much as they are for more skillful methods of cultivation. This premium for an herbarium stimulates not exceptional skill, but a knowledge of classification and nomenclature—a knowledge

that almost all gardeners are deficient in. The idea is offered here for the consideration of the Executive Committee of the S. A. F., as it is firmly believed that our society should be the pioneer in all efforts that tend towards the development of our profession.

The establishment of an experimental garden, recommended by another president of the society, is yet but a suggestion. That this idea if carried out to a practical issue would be a permanent gain to us all few will doubt. But how to make it practicable is the difficulty. A garden of this kind would need considerable funds in the carrying out of a well devised plan before it could be of any real use; and as it should be national and not local it seems impossible that any undertaking of this nature could ever become a lasting success without the assistance and supervision of the Federal Government.

We have no ground for believing that this can be obtained. The need is not apparent to our legislators, and none of us are likely to make a business of lobbying in order to bring our need to the attention of the men who have the spending of the public money. How grand it would be though if the government would establish a garden in different sections of the country to aid in the development of horticulture.

Mr. Battles in his essay upon "education" read before the last meeting of the society also suggests a good plan to assist young men—and older ones likewise in their efforts to obtain information. His proposition is for the florists' clubs of the various cities to establish libraries for the use of their members. It would be somewhat interesting to know how many books each club in this country possesses, which are placed at the disposal of the members. The purpose of every florists' club should be mutual improvement. It should not come together solely for social intercourse. The essays that are read before various clubs by different members do educate and stimulate progress; yet if a well selected library is absent much is lacking that the club might accomplish in the way of education. Many of our most valuable horticultural works are quite high in price, too high for any of the young men of the gardening world to buy. Yet it is these young men we propose to help. How can we do it in any better way than by combining to provide for their use the many serviceable books that pertain to horticulture?

The assumption, then, may be taken for granted that florists' clubs can be educators, and help materially the intellectual progress of their members, but the particular help they render can not reach all. Clubs must necessarily be confined to the larger cities, on account of the number needed to support one. Therefore their influence must be limited in their scope and confined to populous neighborhoods. But as we are all well aware the majority of young gardeners live away from these cities and a large proportion of the members of the clubs are not gardeners, but men engaged in the business of selling the products of florists' establishments, the benefit accruing from the maintenance of a library, and the circulation of the books contained in it, by a florists' club would but very partially attain the end for which it was designed. How, then, can horticultural books be placed within the reach of all who desire to use them? Simply by the formation of libraries in accordance with a plan previously suggested—

namely, that employers shall make this matter a part of their duty to their workmen. The idea is not by any means a Utopian one, but is essentially practicable.

The beginnings of an undertaking of this kind need not be of an extensive nature. The first consideration must be a room well lighted, well heated and properly ventilated. To provide this and to fit it with desks, tables and chairs would have to be done at the employer's expense. Besides this he should furnish the necessary funds for the purchase of a few books and papers. The after expense of maintenance might be shared in some way by both employer and employees. Experience would soon devise a satisfactory plan.

In all projects having progress for their aim the only obstacle that finally defeats the purpose is discouragement. Men as a rule do so soon become discouraged. Especially is this the case in enterprises that are started for the benefit of our fellow men. We do so like to be left alone, we hate to be roused from comfortable sleep. So many benevolent enterprises are commenced from a kindly impulse, but as soon as the indifference of those to be benefitted is manifested all interest in the project is lost. Persistence should be the rule in these undertakings, as much as in those in which our livelihood is concerned.

The expense of an undertaking of the nature recommended would be rather a burden to some—perhaps to many—but if commenced and persevered in it would result in such lasting benefit as to more than compensate for a burdensome outlay. It would be advantageous to ourselves as well as those whose services we require. Look at the rooms that are usually provided for our young workmen. Where is the comfort? Is it any wonder pleasure is sought outside of the four walls? If our workmen are better educated they will become thinkers. From thoughts come ideas, from ideas spring action, and action means progress.

A thoughtful workman will always be the superior of a thoughtless one. Provide him with information about his work—food for his mind to feed upon—and he will think about this work and strive continually to ascertain fresh facts to apply them.

That all the workmen at any given period will reach this standard no one will be so foolish as to assert. Suppose, however, that there is always one interested in educating himself—the employer would not experience any financial loss. To have one thoughtful man on the premises, whose heart is in his work, who is ever studying methods of improvement and developing original ideas, would be to any employer a gain not to be measured by dollars and cents.

The owners of many factories—railroad corporations—and other extensive employers of labor find it to their interest to expend large sums in providing for the comfort and education of their employees during their leisure hours. So may we do and also find that it is to our interest to give attention to this subject.

Practical Education.

On page 68 of the AMERICAN FLORIST is an article on "Scientific Education of Florists" in which the theory is advanced that the aid of the general government could be obtained in founding and maintaining a school for such a purpose. Now it strikes me that it could not be obtained because there are now a large number of agricultural colleges which would be re-

ferred to as doing that very thing. Is this so? Yes and no. They do teach many branches desirable to the trade, but it is a case of too much theory and too little practice, also there is not enough for the wants of a practical florist.

That such a college or training school would be a grand good thing is conceded by all, but the practicability is questioned. Perhaps if the doubters would think a minute this would not be so. We can undoubtedly have a good practical training school for the trade. How? Let a stock company be formed, secure a tract of land suitably located, erect a range of greenhouses of the most approved pattern, dormitories and recitation rooms suitable to the requirements of such a school, make the requirements for admission such as would be furnished by a common school education and the course of study as thoroughly practical as possible without cutting the scientific part to too great an extent; make the expenses to the student as low as possible, and you will have all the students you wish.

As to the course of study, let it embrace enough of the English branches to give a good knowledge of the use of our language; bookkeeping enough to be able to carry on a business; botany, embracing structural and physiological; plant growth, etc.; entomology, enough to know something about the injurious insects; elements of geology and composition of soils; elements of chemistry and composition and value of fertilizers; elements of landscape gardening; and such other things as would naturally pertain to the business, viz.: Hybridization, grafting, budding, pruning, etc. Let there be enough practical work in the plant houses, hotbeds, frames, nursery and field as to give a good knowledge of the cultivation of plants; and let there be arrangements made whereby men in the trade could come and study and observe as they could and you would have as good a trade school as there is in the world.

Such a school would maintain itself after a short time. Perhaps not make any money for the stockholders other than giving them men that could be obtained in no other way, besides elevating the trade generally to a higher standard. That in itself would be something that we are all looking forward to.

ALFRED B. COPELAND.

Springfield, Mass.

Education.

Talk about the education of our young florists and the elevation of our business, didn't we have a practical illustration at Buffalo in the case of the herbariums of wild plants? I have seen a good many herbariums, private, and in scientific institutions, but I never did see a neater or better gotten up arrangement than the one at Buffalo for which the first premium was awarded. The specimens were good, typical, well dried, carefully mounted, correctly named and noted, and tied up in folios which were marked with outside labels indicating the natural order, and these were arranged in botanical sequence in a neat and serviceable cabinet. And on the inside of the cabinet doors the orders were most neatly indexed, and also the number of genera, species, etc., in each was stated. It was a vivid lesson to many of us. It taught us neatness, completeness and accuracy, and, in fact, how to get up an herbarium. And this exhibition of skill, energy and finish was the work of a young practical gardener. Another of the herbariums was gotten up by a florist in Canada. This is a capital

A SUGGESTION FOR A PILLOW

showing in our calling. I regret that I don't know, except by name, the owners of the other two herbariums.

Did the people appreciate these efforts? Indeed they did. I did not enter that hall at any time without finding some people, both men and women, pondering over the herbarium folios, not indifferently or as a matter of curiosity, but critically and with earnest interest. And what a refining and educating influence this sort of work imparts! Yes, and useful too. The donor of the premiums tells me that before he was 18 years old he had been the recipient of two medals for similar herbariums, and to the interest incited in getting them up he attributes the foundation of the methodical ways that gave rise to his successful business attainments.

Let us suppose that you have a family of children growing up about you. If one of them undertakes to get up an herbarium of wild flowers, every other child in your family will help him, you yourself will help him, his mother will help him, his schoolmates or fellow workmen will help him, and in so doing everyone of you are being educated. As his collection of wild flowers increases, his enthusiasm and knowledge increase, his mind broadens, and a love for flowers becomes a part of his being. Now, an herbarium is not a thing one gets up today and throws away tomorrow; it lasts "forever." And the older it gets and the more that

is added to it the more valuable and interesting it becomes. And for reference what a splendid adjunct to one's business!

Parents, if you yourselves are too busy to begin this sort of thing start your children at it and I am sure the joy it will give them will be very gratifying to you. It's when the dear little wanderers—your own sweet little flower-gatherers—come bounding up to you in their delight with, "Papa, see this lovely flower that we have just found down in the meadow there, please tell us what's its name?" and you, their father, and a practical florist too, do not know, that the sting of remorse must pierce your heart, and you would give a good deal if you did know and were able to tell your child.

W. F.

One Suggestion for a Pillow.

This design was first filled in with balsams, making a pure white and symmetrical pillow. The roses used were Perles, Brides and La France, all on their own stems, a few rose leaves and several sprays of ferns.

There are so many ways that pillows can be arranged that we can not understand why some florists should persist in clinging to the old method of first making a line of carnations in the center, with the letters "At Rest," the latter seldom made or put on well; around the carnations a border of tuberose and lilies in the corners.

We think that a few delicate tinted flowers add to the effect of all funeral designs and advise strongly against flowers that are very fragrant.

H. H. BATTLES.

Landscape Gardening in High-Colored Foliage.

BY WM. McMILLAN.

[Read before the Society of American Florists at Buffalo, August 22, 1889.]

Landscape gardening is a subject that embraces a very wide field, only a small corner of which is occupied by the florist. An ornamental landscape is not merely a composition of choice trees, shrubs, grass and flowers, but includes as well every inorganic element of nature embodied in the scene. The "lay of the land"—to use a familiar phrase—is in a double sense the ground work of the composition. This includes every form or feature which the earth's surface presents to us, from the flat plain to the beetling cliff, every variety of hill and vale, ridge or dell, bare rock, sterile sand, or rich soil; and also water, flowing or still, of whatever volume, large or small. Even the atmosphere must be included as a part of every landscape, for the scene varies with every variation of sunshine or shade, dim haze or clear sky, still air or stirring breeze. The lights and shades of a landscape painting are

carefully studied, and whatever is appreciated in the copy is surely of greater value in the original.

In the embellishment then of any grounds of sufficient extent to have a distinctive landscape character, the gardener must take into account all the impressive and attractive natural elements of the place. The general aim of his work will be to make an harmonious combination with the dominant characteristics which nature has already stamped upon the site. He will seek a fuller or richer development of the essential leading features, simply softening what is hard, clothing what is bare, filling out what is meager, and enriching what is beautiful, all in harmony with the original type. He will thus avoid all novel conceits, all conspicuous eccentricities, all incongruous intrusions, and be guided by his understanding of the laws of nature as enacted by the ruling Divinity of the scene, and his sympathy with them.

I lay special stress on this fundamental principle, because it seems to be so commonly overlooked or ignored in ordinary landscape gardening. In fact the very opposite rule is followed in much work that is done, and the result receives much popular approval. It is a common thing to value the decorative work on any given site in general proportion to the degree in which it is obviously artificial, new or peculiar. This unfortunate fashion seems to pervade every branch of landscape work. Instead of the artificial being subordinated to the natural, it is made specially prominent, and in some cases it even becomes the "be all and end all" of the scene. For instance, drives and walks are made unnecessarily broad, or sinuous, or prominent, or intrude where not needed. A sharp terrace is formed mainly to display its bold lines, or a channel is dug for an artificial rannel, to give occasion for introducing a bridge. Summer houses, arbors, rockeries, pools, fountain basins and jets (usually dry), clumps of trees and shrubs, or beds of flowers and foliage plants are stuck around promiscuously in conspicuous sites, without any fitting relation to the natural conditions of the landscape.

A common phase of the same taste is shown in the popularity of the class of plants which propagators call "sports." This includes that numerous list which pads out the pages of most catalogues, the endless varieties with the leaves abnormally shaped or colored, or with a drooping or contorted or dwarfed habit of growth. Very few of the plants of this class are as hardy, vigorous and healthy as the normal type. It is probable that their peculiarities in color or habit are due to some unhealthy condition of the sap or defect in the channels of circulation. But in spite of this relatively weak growth, sickly color or deformed shape they are all popular favorites. The paler and feeble and more distorted the growth the more they are liked and petted and pampered. A few of the best of this class may be sparingly planted as foils or specimens or curiosities merely, but never in proportions to rival those of the true type of each species. For general use the natural color and shape are more pleasing and satisfactory, not only because more vigorous and durable, but also because they are in accord with the true order of nature, while the others are not. Nature in fact disowns her "freaks" of this sort by the general sterility of such offspring. Their reproduction depends wholly on artificial propagation. It were better to

let them all die a natural death than to treat them as if they were nature's finest productions. Her sanction to their continued existence is given only when the seed if produced at all is true to the parent.

The variation of plants under domestication is no doubt a part of the true economy of nature. When the offspring is equally healthy, hardy and comely as the parent or type, the propagation of the new forms may be desirable. But why should we rescue from their natural fate of extinction so many variations that have defective vitality or some constitutional deformity. For example, most of our so-called "weeping" trees are of this class. In the Weeping Willow, White Birch and others, where the young twigs are long and slender, the pendent spray is natural and pleasing to the eye. But where the downward growth is apparently due to some constitutional kink, as in the Weeping Ash or Mountain Ash, the general aspect of the tree gives a painful impression that it is making a prolonged effort to recover from some crushing accident. A similar unpleasant feeling is aroused at seeing the healthy green, so natural to all foliage in the growing state, becoming blanched with white, jaundiced with yellow or livid with purple. It is fortunate that plants, notwithstanding much cruel treatment by cultivators never become subject to a "fit of the blues." If by some violent medication or heroic surgery our "professors of plant propagation" could produce blue leaves their triumph would be complete, and the new color in foliage would at once lead all the rest in popular favor.

The prevalent fashion of using plants with leaves of unnatural hues is most strongly shown in the rapid rise and wide extension of this practice for decorative work in gardens and lawns. "Carpet bedding" and "ribbon gardening" have become an important branch of the gardener's work, and even of the florist's. The trade of the commercial florist in foliage plants is probably greater than in plants grown for the flower garden. Though this is a society of florists, it is quite probable that their interest in landscape gardening is due more to this class of foliage plants than to old fashioned garden flowers. The proper fitting and furnishing of the flower garden or rather the new foliage garden and its relation to adjacent grounds are therefore to you the most important parts of my subject.

What then are the ruling principles which should govern in the decorative work of a garden? In this as in all other things there can be no absolute standard of taste. Personal preferences will vary as the early associations and later education of each individual may vary. But good taste has certain recognized canons by which it may in a general way be judged. There are some fundamental principles accepted by the common consent of the community because in accordance with common sense. On strictly private estates where chiefly the eye of the owner is to be gratified he may ride to his heart's content any hobby that may please him. But in places exposed largely to the public eye as in ordinary villa grounds, suburban gardens and public parks, it is well to have some respect for long established usage, and conform more or less to the general customs of the time and place. Novel ideas will be introduced modestly and not generally adopted till they have stood the test of the fullest criticism. This means more than the ready applause of

the populace which daring novelty is sure to elicit; more than the hotbed stimulus of a fleeting fashion, however popular for a time. Some of these leading principles which should guide the landscape gardener may here be briefly stated.

Flowers and showy foliage being professionally used for ornament should of course occupy the choicest site of the home grounds. The work being necessarily formal and artificial, there will be no incongruity in the close proximity of rigid lines; and the dwelling house may be as near as will best suit the general convenience in the use and enjoyment of the garden. The nature and extent of the collection will of course vary with the taste and means of the owner. The finer the design and the greater the variety of plants the better, so long as there is ample room for all in fitting proportion to the intrinsic merits of each kind, and to the general plan of the whole garden. It is well not to make any ambitious or pretentious display unless it can be easily and willingly kept in perfect order at all times. The immediate setting or surrounding of the garden should be in keeping with the central design. It is poor taste to make a gaudy show of fine flowers or bright foliage if adjacent grounds are weedy and seedy. It is equally bad taste to intrude such plants in formal masses into outlying portions of the grounds mainly devoted to other uses. Even on the ordinary lawn the quiet repose of the green sward may be disturbed by some garish mass of high colors. The discord is equally great when formal beds of like character are scattered along the lawn border amid irregular groups of shrubbery. This incongruity lasts the year round, for after the tender exotics die or are removed the bald plots look equally foreign to turf and coppice. A lawn is one thing, a flower garden another. Grass has recently supplanted gravel in the garden, thanks to the lawn mower. But only in city lots can the plants be properly in such relative proportions to the turf as to convey the idea of both garden and lawn.

In furnishing the flower garden the selection of plants has radically changed with the introduction of "carpet bedding." Old fashioned flowers are now at a discount, and in fact all kinds of flowers unless the color be intense, or strongly variegated or blotched. Delicate tints and shadings or fine perfume are of little account. What is wanted is color only, and color that will strike the eye a long way off, and even then it must be set in large masses to have the much desired dazzling effect. Quantity, brilliancy, oddity, novelty are the chief attractions. The individual plant is nothing, the effect in mass or in combination is everything. In foliage plants high color, strong contrast and fanciful figures in design receive the most favor. The individuals are ruthlessly snubbed and pinched to hide the true character of the plant and show forth the art of the planter.

Is this new fashion better than the old way? Formerly flowers were cultivated solely for their individual qualities. Delicacy of tints and lines was more valued than strong color, and fine perfume more than either. Our regard for them was in direct proportion to our knowledge of the finer traits of character gained only by intimate acquaintance with their daily behavior under all circumstances. Our love was for the individual plants rather than for the general

ANDROMEDA SPECIOSA. [SEE PAGE 113.]

assemblage—for the features revealed by close acquaintance, not merely the strong lines seen from afar. It was won by the true test of long familiarity instead of “at first sight” by fascinating novelty.

The general aspect of mixed borders of bulbs, annuals, perennials and sweet smelling herbs, or of miscellaneous collections of favorite flowers in rectangular panels, was not so neat and trim as clipped beds of fancy forms on shaven lawns; but all the season through, from the first snowdrop to the latest aster, each day brought another flower into bloom, and an ever changing phase in the annual growth of each plant to maturity. Our chief foliage plants in this latitude do not last quite four months, and their general aspect is the same from the first day of the foliage, or a slight increase of color. Color apart, a bed of pot herbs has less sameness throughout the season, while the fragrance their leaves exhale is a constant source of pleasure more refined than can be given through the eye by any variegated leaves, however finely veined, stained, mottled, spotted or spashed. To the true lover of flowers high color either in leaf or blossom is but one of many points of interest. The habit of growth from the swelling bud to the fading leaf may be a greater source of enjoyment, or the fragrance of the bloom may be the chief attraction as in sweet alyssum, mignonette, heliotrope, violet and lily of the valley.

Where the interest lies chiefly in the foliage such bedding plants as give a tropical luxuriance of growth are surely a finer sight than any mixture of the carpet bedding class. Various kinds of canna, caladium, aralia and castor oil plant are commonly used in such beds, but there are many others of like character. Their rapid growth and great size at maturity give a sub-tropical aspect to

the group. Some of the sedges and grasses of warm climates are especially beautiful and effective for this purpose. Some plants of this class have a striped variegation with a truly natural look and much real beauty. It may have originated as a “sport,” but when it has long been known it conveys no hint of being odd or ephemeral. The eulalia, striped maize, and even the old fashioned gardener’s garter are well known examples.

“If variety, richness and contrast of color be the chief aim of the florist why should he seek it in leaves of plants, beyond the natural range from the lightest gray to the darkest green which nature spontaneously exhibits. The shades of green are so infinite that no two species of plants have exactly the same hue, and the manner in which these mingle and blend in any natural landscape, if closely studied and copied, will give more real pleasure than the highest art in arabesque designs in white, yellow and red. If all the colors of the rainbow be wanted in a group they may be furnished in flowers. Every shade imaginable may be matched by some plant. But the taste is surely morbid that would seek to combine in one group any greater variety of tint than may be furnished in many cases by a single genus, as in the tulip, hyacinth, phlox, dahlia, hollyhock or columbine. Yet the hunt for a blue dahlia or hollyhock, a yellow aster or verberna, is still kept up, and is akin in spirit to that in which some new mixture of white, yellow and red in the leaf is sought after. The whole work is false to nature and the foreign color due to disease or distress rather than ‘sport.’

“In the present fashion of using strongly contrasted colors in garden decoration, the strong tendency to run to extremes is well shown in the style of embellishment among the poor for their small dooryards or parterres. It has been well said that

imitation is the sincerest flattery. Hence, we often see in such places a collection of pebbles and cobbles, oyster and clam shells, and such like, arranged in border edgings, ribbons and mounds on the carpet bedding style. When newly white-washed these rival in force of color and distinctness of design any foliage bed. The imitation is sometimes very good, and who now can question the taste displayed or the fitness of the materials used? Round pebbles or even shells make an admirable substitute for the fleshy vegetable rosettes we call ‘hen and chickens.’ They will border a bed or outline a figure with equal distinctness, and vary as little in form or aspect during the season. For inlaid letters in the grass they are even better adapted than the plants we see used. The inscription is clearer and easier to read, and the whitewashed stones and shells are really the most befitting material for such work. Shakespeare wrote it would be folly to ‘gild refined gold, paint the lily, or add a perfume to the violet.’ His satire would have lost its fine point if in his day it had been as common as it is in ours, to embellish dooryards and lawns with white-washed quartz or painted sea shells, to decorate graves with dyed immortelles, and mantelpieces with stained grasses, or add a new scent to a bouquet with drug store perfumery.

“That the taste is corrupt, which approves or applauds the prevalent practices of gardeners in this line, is sufficiently shown by the obvious tendency of the fashion. The motive is not to encourage an intimate acquaintance with flowers or plants, but simply to show what brilliant or bizarre effects can be produced by ingenious combinations of strange colors. Hence the demand for novelty and intricacy increases from year to year, and the strain after effect continues till the laborious effort becomes grotesque or burlesque. The first designs in ribbons, bands, diamonds, stars, crescents, crosses, crowns, hearts, anchors and such like no longer suffice. In like manner simple figures of the geometric pattern are only of use while novel. They must gradually grow in elaborate intricacy till simple wheels and dials become a blind maze of scrolls and convolutions. Then imitations of animals begin and advance from elephants and camels to zebras, giraffes, swans, peacocks, butterflies, snakes and sea serpents. Inscriptions in the grass are also tried, giving perhaps the name of the place, the year or month, or date, the last of course to be changed daily, and so on with labored variations till every possible device be exhausted. The same designs give little satisfaction if simply renewed yearly, for such things once seen have lost the novelty which is their chief claim to attention. The fashion must surely soon run its course because of sheer inability to produce startling effects. If it were the plants under natural conditions that were visited their seasonal changes might satisfy the eye. But we look at them only in bulk to follow the design, and that is always the same throughout the season. When invention flags or fails the popular surprise and admiration is drawn out by making larger beds or a greater or more elaborate assortment of them. This has led onward and downward till collections of several hundred thousand plants have been set out in some private gardens and public grounds.

“The absurdity of the leading motive in carpet bedding may be found in listening to the kind of talk we often hear from

ardent enthusiasts of the practice. A shallow amateur in such work who has not before seen the highest art in this line visits some notable display on some fine private estate or large public ground, and on his return regales his gaping friends with some such description as this: "You can form no idea of the immense quantity of plants in such a garden. A 10-acre lot would be well filled if all were put together. The edgings and ribbons if strung out on end would measure over a mile. They were of nearly every imaginable color you can find in the stores. The ring-streaked, speckled and spotted plants, and those with all shades of bronze and gold were legion. They were set out with the most wonderful ingenuity into so many patterns that carpet bedding was no name for it. There were Turkish rugs, church windows, wheels within wheels, figures of animals, statuary, fancy penmanship and plain print, and elegant figures of all kinds in geometry, trigonometry and astronomy."

What? Astronomy! "Why certainly." "The first thing that struck my eye was a bright bed of fire red coleus, a circular mound raised high up in the form of a half globe. That was a sunset when there is a thick haze on the horizon. Near by was a crescent in variegated alyssum. That was the silver moon. I could not tell whether she was in the last quarter or the first; the horns pointed to the north and were equally correct for either phase. Next came a bed that seemed a combination of both the others. Two-thirds of it was filled with the darkest leaved coleus, the other third was a crescent of variegated stevia in bloom. This was an eclipse. I could not at first tell whether it was the sun or the moon that was eclipsed. After a little study I 'got on to' the gardener's trick. It was either or both, according to your pleasure or fancy. All around were lots of little stars and one or two small disks curiously belted and girdled. Having seen pictures of the telescopic appearance of Jupiter and Saturn I at once divined the meaning.

"There was any number of figures of men and beasts and birds and fishes. A military officer in full uniform was very imposing. A base ball player with club drawn and two prize fighters in full tilt looked dangerous. A boat race of two boats and two rowers in each pulling the oars was quite exciting. In statuary the finest design I saw was a copy of St. George killing the dragon. It was full of spirit and action. A little puff of wind now and again crossing the dragon's head made his jaws seem to open and shut quickly. The feathery stuff used for the tail of the steed actually whisked gently in the breeze.

"The brightest spot of all had a display of flags of all the leading nations. The tricolor, the union jack and even the stars and stripes were easily imitated, but some of the others tried the highest art of the gardener. In the geometry section I was for a long while puzzled by a most intricate figure, the meaning of which I could not make out. At last I detected a faint outline of an arch spanning the whole; that gave me the clue. It was the tough problem in Euclid called the asses' bridge. I remember how it puzzled me when at school, and it is just as hard to see through it in a flower bed."

This "traveler's tale," like the plants he saw, was perhaps rather high colored, but it is in the same line with the general run of such talk. He may have followed the wrong cue at times, but he did not

stray far from the right track. A lively imagination may have seen some figures and emblems not intended by the designer. But worse things than any here described have been actually done. Butterflies have been attempted in a combination of leaves and flowers, living and dead, trained to a frame and set in high relief that they may seem merely to touch mother earth. For special gala occasions models of swans have been covered with newly detached petals of water lilies and set afloat on artificial ponds. Calendars, sun dials and weather vanes have been tricked out in living plants, with painstaking care to furnish daily some useful information, in no other way obtainable, about the weather, the date of the month and time of day (if the sun shine). These ridiculous conceits and all other monstrous creations of this kind are strictly in accord with the ruling motive of the simplest work in the same line. It is either folly or falsehood from beginning to end, because so at variance with the "eternal fitness of things."

The many odd and whimsical patterns into which foliage plants are woven, are in degree only (not in kind), more objectionable than the mere grouping together of large masses of strong color of every hue. Were this display confined to flowers only, it would not perhaps be so glaringly offensive as in foliage, because in flowers brightness and endless variety of color are natural. But to collect together, even in flowers, all the strongest colors we can find, and to mass them into strongly contrasted bands and figures in the present bedding out style, would surely not be considered in good taste. Should we not seek for rich shades rather than glaring contrasts? For quality rather than quantity? As a lady of fashion once wittily said: "Do we measure beauty by the square yard?" Strange though it may seem, there are some persons who would prefer one sweet violet to one acre of coleus. But in carpet bedding it is the broadest carpets and the boldest patterns that draw the biggest crowds. To the commercial florist that is a better "trade mark" than the "government stamp." Whether it elevates or degrades the public taste seems of less consequence.

But fashion is a fickle minded queen, especially to subjects of her own sex. When a fancy notion of no intrinsic value has literally been run into the ground, as this one has been, a slight hint from the throne would quickly change the vogue. Florists nowadays are like milliners in their abject dependence on the latest whim of Her Majesty. It may therefore be more profitable in the long run to give timely regard to the more general cultivation of such bedding plants as will attract attention by some admirable quality inherent in each individual plant, whether it be in flower, fragrance, fruit, foliage or form. To embellish a garden with such plants, however uninviting at first it may be to the ignorant, will give more real enjoyment to the true lover of flowers than to emblaze it with merely so much high color cleverly arranged.

In other things a fondness for loud colors is not considered in good taste or a sign of refinement. Take dress for instance. The phrase, "barbaric pearl and gold" is as applicable to the color as to the richness of the apparel. The fashions in dress of the Chinaman, the Arab and the Turk are not copied by civilized nations, or if imitated at all it is done only by ignorant and foolish people. Aunt Dinah may go to her work in the cotton field in a yellow skirt, blue wrap

and red bandana. Giddy girls may wear "dolly varden" calicoes, and silly duds loud tartans, only to be laughed at by sensible people. The circus clown is true to his assumed character in his suit of strongly marked stripes and bars, and Shakespeare's fool quite consistently exclaims, "Motley is the only wear." When we dress up a garden after the same fashion it ought to seem equally barbaric and foolish, except to ignorant or foolish people. True refinement in either case avoids the cheap and conspicuous, and selects for the richest adornment the choicest material and the softest harmony of tints.

Some of you perhaps may say that "as gardens are made expressly for show and ornament why not bedeck them with anything and everything that is bright and beautiful?" But what is the beautiful? "Aye there's the rub." No satisfactory answer can be given to that question. It is a common saying "there is no accounting for tastes." Beauty appeals mainly to the eye, but in some subtle way we become sensible of it through other senses. We may not touch it but it touches us. In a double sense we judge it by taste as well as by sight. A ripe persimmon has a brighter color than the finest apple, but after you try to eat it the bloom on the apple cheek will probably have to your eye the more inviting look. There are some persons who doubt if to them "a rose by any other name would smell as sweet," or if with its delicious fragrance gone it would look as sweet. On a warm summer day, when a gentle breeze fans the foliage of the birch or poplar, the rhythmical patter struck up by the dancing motion of the joyous leaves, will thrill sweet music in the ear, and thus reveal a new glimpse of beauty to the eye of any one lovingly familiar with these trees, and in sympathy with their merry mood at such a time. This phenomenon may not be audible nor visible to other people, because however intently we may listen or look, the strain will not be heard nor the vision seen, unless our ears be attuned to the right key, and our eyes be opened to receive the light. Our sensibility to the beautiful in nature thus varies with each individual, as so much depends not only on the relative acuteness of our senses, but also on constitutional temperament, mental faculty and personal culture.

Beauty of color especially depends largely upon the light in which it is seen. For illustration, take these opposing views regarding foliage plants. To you as florists your exotic plants look so beautiful on the greenhouse bench among their own kith and kin, that to your eyes an illusive halo may surround them when you see them set out amid the grass and gravel and shrubbery. When you look at the landscape from the inside of your glass houses your plants are in the foreground and all else is dim, distant and diminutive, as if seen through the small end of a field glass. I, on the other hand, standing out amid the native vegetation, see only the "foreign look" of the strange foliage. Because it is "not to the manor born" I may look at it through jaundiced eyes. The point of view being so different the objects seen must have an equally different perspective.

It will seem to you therefore that I have got hold of the wrong end of the telescope. This may all be. Most people see as you do else such work would not be so popular. But here and there I have met a few whose vision seemed as strangely affected as mine. We may be

color blind to the beauty without knowing it, or we look at these things by candle light while you are in the sunshine. My standpoint may be a wrong one, but I simply report things as I see them, and say frankly why I don't like them. To both sides, perhaps, the aphorism may be applicable: "things are not what they seem."

High Colors in Gardening.

Mr. McMillan's essay on landscape gardening has quickened our spirits and set us thinking, talking, writing. He has denounced our "bedding" in parks in vigorous style and is unsparing on high colors and carpet patterns. He assails us because of our conceits, eccentricities and incongruities, and ridicules our taste as being barbaric and corrupt. And he sternly points out to us his ideas of the paths of rectitude. We must respect the man and give ear unto his words, for he is an eminently practical and intelligent gardener, and has the courage of his convictions.

But there are other sides to this question. A public park or garden is the people's garden, and in it the people have a right to expect, demand and have a liberal display of flowers, in variety and quantity, throughout the year, and if they don't have this they themselves are to blame for it, for they own the park and pay for its maintenance.

A public park should be a public attraction, a recreation ground, a pleasure ground, a health resort, a missionary and a teacher. Beyond being a simple landscape picture through which the people may ride and walk and picnic in its groves and play upon its lawns, a park has a further mission to perform. The intelligent, popular park management will exercise every fair means within its power to draw the people out of the city into the park, and the simple landscape picture will never do this effectively, this can be done only by rendering the park so attractive that the people cannot resist visiting it.

The most appropriate ornamentation of a city park is its floral decorations and these need not be antagonistic to the picture, but rather a refinement of it. All manner of hardy flowers are complementary to the park picture and should be displayed, naturalized as it were, in fitting places and with telling effect. These plants were never more popular or freely used than they now are, but the introduction of a herbaceous border would be an execrable innovation.

Every city park should have a flower garden, and provision should be made for it in the original plan. And this garden should be lit up by the very plants upon which Mr. McMillan so unsparingly showers invective. These plants of themselves, individually and severally, are beautiful and capable of being arranged with much elegance and nicety, yea, even with graceful tracery. Quantity is vulgar and blazing masses are wearisome, and the "grotesque and burlesque" may be ridiculous, but they have one redeeming feature: Many people will come to see and gloat over these plant-painted designs and patterns who could not be drawn into the parks by any other means short of a circus, prize fight or horse race. And they will come again and again and bring their families, friends and acquaintances with them, and in this way enjoy the good and share the luxury of our parks—fresh air and a healthful, peaceful and beneficial outing. And, besides, they will find an abundance of what is natural and elegant in arrange-

ment, captivating in flowers and soothing in landscape repose.

Beautiful flowers always inspire admiration and love and their very presence elevates the mind and refines the being; immorality or depravity is never associated with or suggested by them. All people love flowers and beautiful plants, and where shall they look for them in perfection and gay estate if not in the city park or public garden? And it is worthy of note that the parts of the park unadorned with flowers are the least frequented, for the chief attractions of a park are not so much where people ride in carriages as where they congregate afoot and loiter most.

Some who would not introduce painted flower beds into the park at all "are in favor of a liberal display of flowers in the smaller squares, greens and play grounds of a city." Good, so far as it goes, and

JAMES O'BRIEN.

we may hope for tulips in spring and geraniums and coleuses in summer. But where are the colonies of snowdrops, grape hyacinths, daffodils and poet's narcissus spread out among the grass; the moss pinks and arabis and columbines among the rocks, the ferns in shady places, the lilies among the bushes, and the lotus and many colored nymphæas in the pond, the bold grasses, fiery tipped tritomas, gay cannas and brightly tinted garniture in its appropriate sphere? In the park.

And we hope and believe the day will soon come when every prominent city, will have its spacious greenhouse winter garden as well as its open air summer park.

WM. FALCONER.

High Colored Foliage.

When a paper (like Mr. McMillan's) sets everybody talking depend upon it there is something more than common hidden in it. As I said in the last issue of the FLORIST, "It is one of the very best papers if not the best paper ever read before the Society of American Florists." Yet there is something to be said contrary to Mr. McMillan's ideas and statements. It may be that Mr. McMillan is too Mayflower like for a great many of the people of to-day. Every city is not blessed with parks containing so much repose and so many natural advantages as the parks of Buffalo. This may be the

reason then why Mr. McMillan is satisfied without attempting anything conventional.

It is not every park that can afford to do without chromos to make it attractive to the masses, for be it remembered that people in the humbler walks of life can see as much beauty in an ordinary chromo as can those better educated in a Turner, a Millais or a Corot.

Condemnation of sports: Is there not beauty in a Concordia oak, a purple beech or the many forms of the Japanese maples?

Eccentricities: Does not Mr. McMillan think Mr. Hunnell's Italian garden beautiful? and that is eccentric.

Decorative effects: That public parks are made more effective by decoration with temporary plants (and many of these are foliage plants) must be admitted; there is a place for all such work and if there are not places there should be places made. I do not mean for puglist designs or for animate(?) subjects, unless perhaps they can be in motion; but surely there is beauty in well balanced, well colored and well selected groups, though they may be somewhat geometrical.

Foliage leads flowers: Yes, at this moment I have before me grand mounds of sumach, surpassing even Coleus Verschaffeltii in color, and the mounds are many of them very formal, a wood side covered with tulip trees of glorious yellow tints without jaundice, dogwoods equally, Perilla nankiensis in blackness, and maples of a dazzling scarlet, brighter than Joseph's coat, and these are all older than any foliage bedding plants.

In conclusion: That some needed reform in some of the foliage beds is necessary and important; that more variety in hardy perennials and more extensive plantings should be encouraged; that the education of all concerned is progressing in the right way, and that Mr. McMillan's paper has and will help along the good work can not be gainsaid.

JOHN THORPHE.

OBITUARY.

JAMES O'BRIEN, late treasurer of the Gardeners' and Florists' Club of Boston, died at his home in Jamaica Plain, Mass., September 25, at the age of 62 years.

Mr. O'Brien was born in Cork, Ireland. He came to this country in the year 1847 and soon found employment on the estate of Gen. Sumner at Jamaica Plain, where he remained some 20 years. On leaving the employ of Gen. Sumner he removed to his late residence on Union avenue and entered extensively into the raising of flowers. While devoting most of his time and attention to his local retail business, he has grown considerable quantities of flowers for the Boston trade. His great success with specialties such as primulas, cyclamens and cypripediums, shows him to have been a gardener of no mean order. His place was always kept neat and attractive.

That he was also a man of taste and refinement was shown by the many tasteful drawings and paintings, the work of his own hands, which he always took great pleasure in showing to visitors at his home. He had the honor of being known as "the father of the Gardeners' and Florists' Club," he having made the original motion which resulted in the formation of that organization. Although he belonged to other bodies this was his favorite, and up to the day of his death all through his long sickness, he never lost his deep interest in its welfare. A number of the members attended his funeral, including Jackson Dawson and A. P. Calder, who represented the club,

as pall bearers. He was also a member of the Society of American Florists and of the Mass. Hort. Society, and at one time served on the plant and flower committee of the latter organization.

As a gentleman and a friend Mr. O'Brien stood pre eminent. He was a man of kindly, sympathetic disposition and was sincerely respected by all who knew him, for his steadfast integrity and goodness of heart. He was a most worthy representative of the gardening fraternity and in his death we have lost not only a kind friend and neighbor, but a man who was an honor to the Florist trade of Boston.

W. J. S.

Pruning.

In reply to the question of carnation pruning that I advised in an article which appeared in April 15 issue, and which Mr. H. E. Chitty in his worthy article of the 1st inst, requires me to substantiate. I feel that I can do nothing better than to re advise the use of the knife during the early growth of the plants.

Mr. Chitty and myself are aiming for the same end, viz., a stocky well developed plant. When I begin using the knife the cuttings are too small to allow me to draw out the center shoot, I always cut off the tops before they are dibbled into the sand. This early trimming induces a growth of laterals and during the time the cuttings are in the sand (about three weeks) the many and desired side shoots are plainly in view. Those that are apt to run up really do look "rabbit eaten," but what of that, it is only a premature flower stem and will soon be completely lost in the center of the stocky growth coming up all around it.

It is a hard matter to name any certain date to discontinue pruning, as this season has proved beyond a question. "Michigan has been cutting up awful this year," as old farmer Sponable said to me the other day. "The season opened hot and dry, then changed to cold and dry, later wet and cold, and all the rest of the time it has been dry and cold." This year the last time I trimmed the tops of my carnations was April 15, from that time on until August it was interesting but discouraging to watch the slow growth the plants made. Had I continued my pruning this season as ordinarily I would have had no bloom until next March.

Regarding the time of lifting I think some good time in August suitable for this latitude. I notice that it is best to go over the plants, selecting those most forward first, and if there is any one stage of growth better than another for moving the plants, in my opinion it is when the terminal buds are almost developed.

THOMAS L. BROWN.

Grandville, Mich.

Callas and Pelargonium Cuttings.

Subscriber, Barrie, Ont., Canada, will find that his large plants of calla lilies will bloom during winter and keep on blooming up to July if he gives them ordinary good care and manure water two or three times a week after they get

pot bound, but if he, for some special purpose, wants a number of smaller plants in bloom in the month of May, I should advise him to buy a lot of medium sized dry bulbs, keep them in a dry, cool place until middle of February and then pot and start them in a temperature of 50° to 60°. They will push out leaves at once and after about two months flower buds will be produced freely. He will also notice that the buds on these newly started plants will open and expand faster than those on the older plants which were kept in growth all fall and winter.

As to his failure in striking pelargonium cuttings in the fall he will overcome that difficulty if he prunes in his stock plants rather severely after blooming and then sets them in a good greenhouse to make new growth. Protect them from the direct rays of the sun without actually keeping them too dark and water sparingly for a time until new growth is fairly out. Cuttings may be taken from these plants any time in summer, fall or winter and will root as freely as geraniums. The moisture in the house will produce a growth entirely different from out door wood and the cuttings made of this growth are almost sure to root if proper care be given them in the sand bed. They dislike shade and therefore very little of it should be given. As to his direct question, "When is the best time to strike the cuttings," I would say, that there is no fixed time, it all depends on the stage of growth the stock plants are in, whenever you can get half hardened cuttings two to three inches long put them in, it is the best time, but I should prefer the month of August.

Rochester, N. Y. J. B. KELLER.

Arboretum Notes.

VII.

As seasons generally run we do not look for blooming shrubs in October, hence when we take a ramble through the Arboretum collections it is with surprise and a convincing reminder of the many unusual features of the past season, when we find weigelas, spiræas and other spring-flowering shrubs in bloom on October 4. I saw *Rhododendron Dahuricum* in bloom, *Vinca minor* both blue and white varieties thickly dotted with flowers, also *Daphne alpina* and *cneorum* and *Spiræa Thunbergii*.

Spiræa Japonica var. *Bumalda*, is still blooming having been abundantly covered with its rosy pink corymbs continuously since July, and every young shoot now bearing buds which would extend the blooming period indefinitely if the frost would only stay away.

A number of andromedas are also opening their flowers and Mr. Dawson feels somewhat anxious about the effect on these plants should sudden cold weather find them in their present condition. There are a few scattering hypericums still in flower.

Stirking one side of the lawn at Mr. Dawson's house is a long bed devoted entirely to plants of the composite family. It contains ninety varieties of asters, solidagos, bolonias, etc., and up to within a few days has been a magnificent sight.

A singular appearing shrub, which, although a native of our eastern coast appears to be but little known, is *Baccharis halimifolia*. The male plant is of no value but the female is very showy when in bloom. The flowers are little woolly tufts somewhat resembling graphaliums and are borne in great profusion. The foliage is of a bright waxy green and the habit of the plant good.

By far the finest late autumn blooming shrub seen is *Caryopteris Mastacanthus*. This is a new plant, recently imported and is not yet proved as to hardiness. The flowers are light blue in color and borne in the axils of the leaves. If found to be hardy it will be one of the most valuable acquisitions of late years.

But it is on the fruit bearing shrubs and those with bright tinted autumn foliage that we must mainly rely for bright colors at this season of the year. *Clematis graveolens* looks like a bank of mist, so thickly is it covered with its feathery seed-pods. A fine *Celastrus scandens* trained over a post makes a superb show, with its pendent clusters of scarlet berries and bright orange capsules.

"The gem of fruiting shrubs": so says Mr. Dawson as he points out a superb specimen of *Berberis Thunbergii*, and he is pretty near right. It is hard to beat, and no shrubbery is complete without it.

Eunymus Europæus with bright scarlet fruit, and a white fruited variety are now at their best. *Ilex verticillata* is also seen in the showy coral berried variety, and a kind with yellow berries. A rare shrub from China is *Panax sessilifolium*. The black fruit is borne in round bunches at the tips of the branches.

Mr. Dawson recommends summer pruning for the Golden Elder (*Sambucus aurea*). The branches are cut back a short distance, thus developing a second growth of young shoots which fill in the plants with an abundance of young foliage and keeps it looking very bright and fresh into late fall. When seen from a distance a plant of this variety is the most striking object in the Arboretum nursery. Near to it is a *Cornus Siberica* from which the foliage has dropped. No other plant has such a glorious color on the stems as this *Cornus*. The bark is almost pure vermilion, and the effect as seen against the golden background of the *sambucus* is brilliant in the extreme.

The *sumachs*, *venenata*, *copallina*, *glabra*, *semialata*, *typhina*, etc., are now at their brightest and glow in the sunlight like flames of fire. Many of the maples and other trees are already beginning to turn yellow and drop their foliage, and the prospects for the annual gay display of rich autumn colors for which New England is so famous are not encouraging, a result attributed by Mr. Dawson to the excessive rains and dampness of the season through which we have been passing.

Boston, Oct. 7. WM. J. STEWART.

Rochester Notes.

BY WM. FALCONER.

Eulalia Japonica is used as a hedge plant by George Savage and with pleasing effect. It is planted along the street fence and the line bounding the property and though only a grass its bold contour and luxuriance of variegated foliage are quite striking in this position. Of course as a fence it would not be of any use.

Stephanotis in a cool house. Mr. Savage grows it in this way and very successfully. Under these conditions it makes excellent growth in summer, blooms well and is far less apt to be infested with mealy bugs—its inveterate enemy—than when grown in a hot greenhouse.

Imantophyllum. George Savage believes in them and grows lots of them for winter flowers. They are evergreen plants of the *amaryllis* order and natives of South Africa, but recently several fine garden forms have been obtained. The flowers are large, showy, flame or orange

IMANTOPHYLLUM

and yellow, and produced in umbels of 10 to 20 terminating stout scapes 15 to 30 inches long. By resting them now—keeping them rather cool and dry—they can be brought into good flowering condition any time in winter or spring with a little forcing.

Allamanda grandiflora is a Brazilian species and one of the finest of the genus. It may be successfully cultivated either as a pot plant or planted out in the greenhouse. George Savage prefers it planted out. But Thomas Baines, who a few years ago was the best plantsman in Europe, says it "is most suitable for growing as a pot specimen, in which way it may with advantage be trained to sticks, trellis being dispensed with." This is all right for Europe, but here we want freedom for our plants as for our people, and I believe with Mr. S. plant it out. The great advantage of *A. grandiflora* is its most free blooming nature. *Allamanda Schottii* is the species most commonly grown, and surely it is one of the grandest plants in the universe, magnificent in the greenhouse anywhere and in the open garden in Southern California.

Ophiopogon Jaburan (Snake's beard) is a little grass-like tufted plant that I saw a good deal of about the Rochester gardens. Besides the plain green-leaved form there is a variegated one, and both have an abundance of small bluish flowers, densely set in a raceme terminating a scape some 12 to 24 inches long; there is also a white flowered variety. It is not hardy, but will bear some 15° of frost with impunity. As it blooms in late summer it is appreciated in the flower garden in slightly shaded places; it makes pretty greenhouse or window plants and is a suitable companion for ferns. A native of N. E. Asia. Propagated by division.

The luxuriance of *Auemonia Japonica* at Rochester was a revelation. The big

clumps were very vigorous and displayed no signs of injury by winter. But what interested me most was the way in which young plants were coming up like weeds all over the ground occupied by other crops. No doubt the anemone was once grown in these grounds, and on being removed the pieces of broken off roots gave rise to the plants that now were so freely scattered about. The heavy and long-continued covering of snow protects the roots in winter and in this way renders this plant hardier there than on Long Island where it is not reliably hardy.

If hardy plants are doomed to destruction as some would have us believe, what a retrogressive race these Rochester florists must be, for every where we went—and we had a hurried run through several florists' places—hardy plants occupied a prominent place in their grounds. But these florists are all right. Hardy plants have never before been in such booming condition as they are now. Landscape gardeners are using them by the hundred thousand, and of several things the supply is not equal to the demand. If they hang upon a florist's hands it is because nobody knows he has got them, or he has an indifferent selection, or he has not got them in sufficient quantity to justify the landscape gardener in bothering with them. But, too, there is a growing retail demand for hardy plants. It is evident to every large plant florist around New York that the excessive use of bedding plants, conspicuous a few years ago, is being curtailed, and mixed gardening is becoming more and more fashionable. Take Newport, R. I., the most fashionable summer garden city in the country, as an example, and you will find that hardy trees, shrubs and perennials form a far larger bulk proportionately of the decorations of the gardens than they did a few years ago. And see how our florists are drifting. Take

Siebrecht & Wadley, of New York, for instance, with their enormous greenhouse establishment and collections of orchids and fine tropical plants, they are adding an extensive hardy plant department to their business. Do you think they would do this if they didn't smell a dollar in it? Not much. Now so long as we have homes and gardens so long shall we need bedding plants and enormous quantities of them, and at the same time so long shall we need hardy perennials and enormous quantities of them also. Then let us govern ourselves accordingly.

Andromeda Speciosa.

This is one of the most showy flowered of all the andromedas. The flowers are pure white in drooping racemes, the individual flowers often measuring one half an inch across. It is a native from North Carolina to the pine barrens of Florida and is usually found growing in low swampy ground. This handsome species was introduced into Europe about the year 1800, where ever since it has been much appreciated, and it is much more easy to find plants in European nurseries than in American ones.

This shrub is of slow growth, usually flowering at four years from seed. It requires careful handling during the first year, but after that it is comparatively easy to manage. As the fashion of forcing shrubs is growing this would be a plant which if once introduced would be much sought after. It flowers about the same time as *Deutzia gracilis*, and as all ericaceous plants lift easily when well grown it could be potted in late fall and kept in a cool pit until wanted. By having a supply it could be had in bloom from February till June.

JACKSON DAWSON.

Rochester Notes.

Apart from being one of the most complete and valuable collections in the country, the Kimball orchids are one of the best grown, and not only are they grown with a view to good looks as plants but also for flowers. When European nurserymen begin to attach the names of American cultivators to orchids of sterling merit, for instance *Vanda Kimballiana*, *Vanda Amesiana*, and *Cypripedium Morganianum* it means that these names are of much importance in the new world. Orchids that bloom in winter are more to be desired than those that bloom in summer when "nobody" is at home and we have lots of outdoor blossoms, hence an effort is made to retard the too early or hasten the too late to suit the winter season; but in so large a collection as Mr. Kimball's there are lots of orchids in bloom all the time, and not only one plant of a kind, but perhaps hundreds of a kind.

Laelia Dayana was in all its glory in little baskets and pans suspended near the glass. Some *Brassavolas* were in bloom and although not very showy are much liked among cut flowers. *Oncidium varicosum* and its variety *Rogersii*, both magnificent orchids had thrown up flower spikes as stout and long as stems of garden asparagus.

The lovely gilded butterflies of *O. Kramerianum* occurred most everywhere. Mr. S. says the secret of success in its cultivation is don't give it much water. *O. Forbesi* and *O. crispum* displayed the vast floral profusion of some orchids in comparison with the size of the plants.

Saccolabium Blumei was both striking and beautiful; its dense racemes of fragrant rose-tinted flowers hung down 17 inches long and several to each little basket.

The perfumed *Odontoglossum hastilabium* was in good bloom. And I noticed that all the plants of *O. citrosum* were grown in suspended pots or pans; this is to preserve the young flower spikes from the voracious slugs.

Many *cypripediums* were in bloom. One compartment was nearly filled with large plants of *C. insigne* (not in bloom, of course) which Mr. S. called my attention to to show that cool, airy treatment in summer is better for them than warm, close quarters; they may not make such rank foliage but they will out-blossom any coddled plants.

The pretty little *Laelia monophylla* was in bloom, so too were *Phalenopsis Esmeralda*, *Epidendrum vitellinum majus*, *Maxillaria grandiflora* and *venusta*, and some others.

Some *renantheras* interested me much, for unlike as we usually see them they were strong and vigorous and had been in grand bloom shortly before I saw them, the long and branched spikes and faded blossoms attested this fact. They included *R. mutata*, *R. histrionica* and *R. Storiei*.

Bulbophyllum Lindleyanum and its varieties *album* and *roseum* were the liliuputians among the orchids; their pseudobulbs were about the size of peas and their leaves about an inch long.

Among *Utricularias*, which are bladderworts, besides *montana* and *Eudresii*,

Mr. Kimball has several other tropical species, conspicuous among them being a gigantic one from Brazil and called *U. reniformis*.

Mr. Savage likes small glass houses for growing orchids in very much better than large ones. Cockroaches trouble him as they do the rest of us. As traps for them he uses wide-mouthed, transparent, glass bottles, about one-fourth filled with sweetened water; the cockroaches in attempting to get at the sweets fall in and as they cannot climb out again, get drowned. And Mr. S. assures me that in bottles in which one or two roaches are already drowned he can catch more than in those from which the dead roaches have all been removed. The presence of one or two of their kind already floating in the liquid instills confidence into the others to come in too. W. F.

Hail Storm at Philadelphia.

A severe hail storm struck this city on Tuesday October 1, shortly after 5 p. m. It was accompanied by sharp claps of thunder and the most vivid lightning that I ever recollect. It is unusual to have hail storms at this season of the year.

The damage done can hardly be estimated, and especially is this so just now, when everything should be snug and tight ready for winter. It extended about six miles square. On the west from 60th street to 10th street on the east, and from Susquehanna avenue on the north to Baltimore avenue on the south.

So far as can be ascertained the following are among the heaviest losers: Craig & Bro. about 7,000 square feet; August Lutz and David Bearn one fifth of their glass; Jacob Becker one eighth; D. D. L. Farson one sixth; James Shelly light; Frederick R. Krebs very heavy; Henry Engler two new houses recently finished completely wrecked, in addition to his other houses; Julius Wolff, Sr., only 10 square feet, whereas Edward Bayard not far away lost very heavily; W. F. Fancourt, Philip Alburger and the Fergusson Bros., near neighbors to the two last named, did not lose a pane; James Kent and George W. Carpenter were badly damaged; James Cole about one eighth of his glass; Clarence Dunn and William Sutherland were both hit hard.

The storm seemed heaviest in the neighborhood of 22nd and Diamond Sts. Habermehl Bros. lost quite three fourths of their glass; Charles Fox and Joseph McMurray lost some, and A. Blanc's cactus houses were slightly damaged; Supplee & Brown and William Scott & Son are among the unfortunates.

The storm which equaled this one in severity and the area covered happened May 1 (Sunday), 1870, and two years later a heavy one struck here, and not more than two years ago Dennison Bros and Faust & Bro. were damaged by hail to a great extent. In 1870 the Darby Road florists caught it very bad, but on this occasion we are glad to record they were not touched nor were the last two firms named.

Robert Craig says that on their place the double thick glass was not broken nearly so bad as the single thick. Wm. K. Harris says that he would not use single thick glass for glazing greenhouses if he could get it for nothing.

Dan Farson says he "thought he was outside the hail belt, but he was belted by the hail like hail." Some of the florists were insured in "The Florists' Hail Association of America," but the majority of them were not.

Some glass was broken in the green-

houses in Fairmount Park, and the houses in the Girard College grounds were sadly damaged.

One redeeming feature in this unfortunate matter was that very few plants were injured. EDWIN LONSDALE.

Boston.

The frost has kept away from us most persistently thus far, a most gratifying condition of things to those who possess or who admire outdoor floral decorations, but not so pleasing to those who depend upon the sale of flowers for their living.

Much as the latter may admire verdure clad shrubberies and gardens gay with *salvias*, *geraniums* and *cannas*, yet they can not keep down the longing for the withering frosts and cheerless cloudy days which bring life to the flower market and put prices somewhere near a living figure. As it is the rose market is in a deplorable state, with slim prospects of immediate improvement. All the standard kinds are abundant, good and cheap. Outside of roses there is nothing extra choice with the exception of lily of the valley. There is a fair supply of carnations and asters, the white varieties being the only kind salable however. Tuberoses, *mignonette*, *candytuft*, with a few violets and *callas* are about all there is besides. A few straggling *chrysanthemums* are seen. They are of finest quality and bring almost orchid prices. *Adiantums* and *smilax* are in good supply.

The monthly meeting of the Gardeners' and Florists' Club on October 1 was well attended and was a most interesting occasion. The subject of "bulbs" was discussed, particular attention being paid to *freesias* and *aucumenes*. The drift of the *freesia* discussion indicated that the average market price of this favorite had got about as low as any one can afford to grow it. Regarding *aucumenes* it seems that there is a possible future for them, but care is required in handling the bulbs, especially in the matter of keeping them dry or nearly so from the time they are planted until they begin to grow. *Dahlias* were also discussed and a very handsome vase of the blooms was shown by Mr. John Parker.

Mr. C. M. Atkinson exhibited at Horticultural Hall on October 5, a nice plant of *Vanda Kimballiana* with a fine spike of flowers on it. It was specially interesting from the fact that this was the first time any one has succeeded in blooming it in this country. It was awarded a silver medal.

The annual election of officers in the Mass. Hort. Society was held on Saturday October 5, and resulted in the choice by a large majority of Wm. H. Spooner for president, and Patrick Norton as chairman of the committee of arrangements. These were the two principal offices over which there was any contest. The opposition took advantage of the apparent loyalty of the gardeners and florists to the regular nominations to cast discredit upon their motives and to create an unjust prejudice against this element in the society. This fact, together with the adoption by the opposition of certain other tactics which were generally disapproved resulted in an enthusiastic rally to the support of the regular ticket which was elected by an overwhelming majority. It would certainly be most discouraging were this society to admit the plea that with a record of over half a century it had failed to develop a floricultural constituency within its membership worthy to be entrusted with a fair share of its responsibilities and an equitable representation in its councils, and it is to the

lasting credit of the Mass. Hort. Society that this epoch has been so thoroughly buried that it will doubtless be a long time before any self constituted saviors of the society will again have the temerity to resurrect it.

Strange as it may seem there are still a few individuals left who would insist that the officers of a horticultural society should be anything under the sun except practical horticulturists, and who resent as an unpardonable sin any claims to social equality on the part of "gardeners." We read in English magazines of under-gardeners, so called, who do not dare to sign their names when contributing to the horticultural periodicals lest they may lose their situations in consequence of their ambition. Fortunately the atmosphere in this part of the world is not favorable to the propagation of that species of vegetation, and it is most gratifying to be able to record that in this year, A. D. 1889, the strongest and most honored horticultural society in the world has stood up to be counted, four to one, on the right side. WM. J. STEWART.

Philadelphia.

At the last meeting of the Florists' Club the annual election of officers resulted as follows: President, Robert Craig; Vice-President, C. D. Ball; Treasurer, Thomas Cartledge, Secretary, Henry F. Mitchell.

The Treasurer's report showed a balance on hand of over \$1,000. The idea of buying a club house, to be kept open at all times for the benefit and convenience of the members, is still talked about, but nothing definite has been decided upon.

A paper was read by John Burton on "The advantages of steam over hot water and hot water under pressure for heating greenhouses," which was by motion ordered to be forwarded to the FLORIST for publication.

Trade is improving and the outlook is promising for a good season next winter. E. L.

Wind-Tight Ventilator.

The accompanying sketch gives a sectional view of a wind-tight ventilator designed and used by Mr. J. T. Anthony, a Chicago florist. The opening in the roof is eased clear around inside with a strip which projects about an inch above the surface of the roof and the weather strip on the outside is carried around three sides of the ventilator sash. The joints on the outside should be well filled with paint.

This adds but a trifle to the first cost of the ventilators and excludes much cold air that would otherwise drive in when a cold wind is blowing, and renders the sash less liable to be lifted by the wind. Mr. Anthony has found them so satisfactory after a year's trial that he is arranging all his ventilators in this way.

Leaves of Advice From a Limb of the Law.

(For Young Florists.)

IX.

You say you have struck it rich this morning, hey? Good, I'm glad to hear it; you work hard, are temperate and economical and you deserve to make a hit now and then.

Let's hear what you call striking it rich. Sold a bill of \$100 to Contractor Grubbs have you? ornamental shrubs for the lawns of three new places he is building. That sounds well. But look

out for Grubbs. Grubbs is a hustler, but he is not a safe business man. He is keen at a bargain and somewhat unscrupulous as to methods.

Oh, ho! So in return for this order you are to go on his bond as the builder of the new bridge. Don't do it. The fifty dollars which you make on this order for the shrubs may be the hardest earned since you started in business for yourself.

I don't say that a business man should never go on a bond for a friend, for some one must do that sort of thing; but I do say: "Don't go on Grubbs' bond." No matter, that doesn't change the fact of your liability for the whole amount. The other bondsmen may die insolvent, where are you then?

WIND-TIGHT VENTILATOR.

The contract of principal and surety is a peculiar one. Let us look into it for a moment. The law does not allow you to attach any conditions to your guaranty that another shall or shall not do or leave undone a certain thing. Your guaranty must be absolute; it must be in writing, the thing to be done must be a legal act, and there must be a consideration accruing to your principal; that is, no man can guaranty the payment of a debt already due and owing. You understand that the very instant you sign as surety for another you put a lien on all your property.

True, many persons when they find that their principal has defaulted, or is likely to default, put their property out of their hands and whip the devil around the stump by doing business as "agent" or "manager." This is wretched business for a man who expects to make a name as a successful merchant or trader.

There is some consolation for a man who guarantees or goes surety for another and it is this: The contract or agreement must be most strictly construed. I'll explain. Suppose you guarantee the payment of a note and when it falls due the payee extends it. This would release you. In fact, any change in that note, rate of interest or time or place of payment would free you from your contract to make it good.

But suppose you go surety for my rent, the mere fact that the landlord accepts fifty cents on the dollar for one or more quarters will not release you for the balance of the term. But if the landlord in any way changed the amount of rent, time of payment, etc., you would be released from all liability as surety.

You say you hold a written guaranty in the form of a letter from a certain rich man in this town promising to be responsible for all bills of cut flowers which

you may be called upon to deliver to the lady managers of the coming church fair. It is not a good guaranty. It omits one of the essential points for it fails to state what sum such guaranty shall cover. Have it reformed at once by getting the maker to insert some fixed sum.

So too, you must take care that an agreement to make good, states specifically the time which it is to run. No guaranty can run indefinitely.

Now we are getting a pretty distinct idea of what a man must do in order to be held responsible for the action or default of another. He must specify what he is to be responsible for, the time how long and the sum how much. Then he must sign the agreement at the end thereof.

Bonds are usually executed under seal with witnesses. But the ordinary contracts to be responsible for another do not need these formalities. But there must be some sort of writing in ink or pencil; a mere verbal promise is worthless, absolutely so.

Now you ask what your liability would be in case you went on Grubbs' bond and the town should get a judgment against him. Bondsmen are liable "jointly and severally," that is for the whole, or if three contribute for a third. The law holds fast to each bondsman and says: "I may let you off with one third, but if the two others don't pay then you must pay all."

Yes, you are right. If a surety, bondsman or guarantor pays the debt he then has a claim for the amount against his principal. But if you find it necessary to become surety for another, make a "mem" of the date when the obligation falls due, hunt up the creditor and demand that he at once begin a suit against your principal for the amount. This is very important. For it may be that your man had money at that time and that he was one of those chaps who never pay unless the screws are tightened. In this case, upon the neglect of the creditor to sue for his demand, you would be exonerated from your guaranty.

No, it is not necessary that a guaranty should be addressed to any particular person. If you write the words: "I hereby guaranty the payment of within rent," and sign your name, that guaranty would be good even if the landlord should sell the house and your man become the tenant of some one else. The law says, quite correctly, that it makes no difference to you into whose hands the rent may be paid. You are helping out your friend, that is, you are enabling him to gain some advantage, draw some profit and this is (mark well) the consideration which moves you to put your name down as surety.

So, as I said before, the law doesn't permit you to guaranty a "dead horse." By that I mean that if you owe fifty dollars to Tom, Dick or Harry for goods had and received the law will not permit me to guaranty the payment of that old debt unless some new promise is coupled with it. For instance, suppose your creditor says to me: "If you will guaranty the payment of that old account I'll reduce the amount to forty dollars." Here the guaranty would stand, for a new consideration arises.

Good. I'm glad you asked that question. Yes, strange though it may appear, if you guaranty the contract of a minor you must pay. Bear this in mind, for young men are very fond of flowers and some "smart Aleck" might think he was not incurring any liability to go security for a boy. UNCLE BLACKSTONE.

HIGH COLORS IN GARDENING.

At what point shall we find a resting place in following the logic hidden in the able and smoothly written paper of Superintendent McMillan? We trust we do him no injustice in stating that he inveighs against all carpet bedding, all foliage plants except with green leaves (barring sub-tropical) and all flower beds where masses of very bright flowers are shown. Truly such a critic leaves the greenhouse plantsman a narrow spot to turn upon.

Mr. McMillan is undoubtedly a rare lover of "nature unadorned." No narrow street lines hem his landscape, no 6x9 or 3x25 door yard should enclose his daily walk. With what unrest would he view the interminable lines of brick and stone of Fifth Avenue, New York, or Michigan Avenue, Chicago, and where, if he was brought to live on such avenues, would he find the room for those beds of old garden flowers or those massive sub-tropical effects which he does permit in those colors? Surely Mr. McMillan's Utopia is

"Where wild in the woodlands the primroses blow."

For the new and crowded city streets leave little room for his ideal in flower gardening. Granted that the widespread lawn, the hedge rows, the fragrant garden flowers, the herbaceous borders, are high types of horticultural taste in these directions, yet where is today the space for their adoption in thousands of city homes?

The city residences stand not amid green foliage on an extended lawn, but beneath high walls of similar brick and stone structures on every hand and little of nature visible except the sky above or that part of it which ends in long street vista.

This very condition so wholly artificial, justifies a miniature, an artificial and a brilliant effect on the small spot of garden which shall stand for the great expanse in the country villa of Mr. McMillan's taste. It is artificial, but it is not necessarily inharmonious, be it as bright and as much of a carpet bed as it may. Neither will we admit that colored foliage of any kind is necessarily in poor taste. Yellow coleus, bronze cannas, purple alternantheras can no more be said to be plants only for morbid admirations than can the close cropped green lawn during the autumn days, for why not follow out the logic and let the grass grow, blossom and turn brown as fits the season and the "turf beneath our feet" touch us with that sweet sadness that autumn always brings as she steals on and hints the end of the summer life of all vegetation. Why force her into perennial spring and unseasonable green with the noisy barbaric lawn mower and the snake like hose? We will admire nature with you, for she is truly lovely in

all her moods. We will not love the artificial as we love the other, but we must admit its embellishments.

But what of the intricate and barbaric figures in designs in our parks? We do not defend them, nor do we say they should not be. Give us variety if variety is necessary to please and attract the public with it; let also the tasteful and the artistic make their appeal to the human heart and the favorite and fittest shall survive. But surely it is not the first thing to attract the attendance of your citizens to the park and is it wrong to do that by the great human cord of curiosity, if they have not the true delight in nature they should have?

Will Mr. McMillan kindly suggest the remedy or the substitute for the bright colors or the carpet bedding which form to-day nine tenths of the bedding work of the average florist in the small gardens of our cities and towns. He who tears down should certainly furnish some material to build with.

The dried immortelle, emblem of immortality is dear to the French, and in its natural color (yellow) has adorned their graves for hundreds of years. The dyed purple of the same is used in America, purple seeming to us a more appropriate color. Here the immortelle still typifies the immortality if you only think so, yet Mr. M. says the purple immortelle is ridiculous. What then of the yellow? Has the nation which stands at the head in art been mad for a century with the yellow wreaths on the tombs of its Voltaire or Hugo?

A REICHENBACH INJUSTICE.—A. B. was a very successful botanical collector and discovered several new orchids in the East Indies and Indian Archipelago. Some of these were imported alive into Europe and are now in general cultivation, and the discoverer has received due credit for them. But he discovered several species, if not some genera, new to science, and of which he was able only to secure herbarium specimens. On returning to Europe he sent these together with complete information about and drawings of them to Reichenbach, but he has never heard anything further from them, and now they are locked up in the Reichenbach herbarium to remain there sealed from the world for the next twenty-five years! In the meantime it is quite probable that C. D., E. F., and others may rediscover these new plants in their native wilds and secure living or herbarium specimens of them, and submit them to the authorities at Kew for identification or name, and have the credit of being the original discoverers. This is very galling and ill requites the dangers, privations and sickness A. B. underwent, his enthusiasm in the field and his passionate love for orchids. But it is a stinging lesson—it teaches us how unsafe it is to trust our eggs in any one man's private basket. Had Kew or some other noble, liberal, public institution of the kind been entrusted with the identification and classification of orchids no such injustice as that done to A. B. could possibly have been done.

SEEDLING CARNATION.—A carnation bloom, delicate pink in color, of large size, with perfect calyx and on a long, strong stem has been received from W. Bertermann of Indianapolis, who states that it is a seedling raised by Fred. Dörner, La Fayette, Ind. The bloom is certainly handsome, but we fear that the color is not positive enough to make it a seller as a cut flower. We understand

that Mr. Dörner has been quite successful in crossing the carnation and has a number of other promising seedlings. It is gratifying to know that more American growers are devoting attention to hybridizing and crossing.

THE BOUNDARY LINES of the "Hail Belt" are still far from being accurately determined. Philadelphia's recent unfortunate experience certainly proves beyond question that the eastern "boundary" is not west of the Alleghenies, and that coast cities are no more certain of exemption from hail storms than others. It is a curious fact that on two different occasions and in two different cities a florist who did not have his glass insured had it broken by hail while his neighbor who carried insurance escaped. The Florists' Hail Association seems to be a very effective "mascot."

CONVENTION PHOTOGRAPH.—A copy of the photograph taken at the hall park at Buffalo during the convention has been received from E. F. Hall & Co. the photographers, 306 Main street, Buffalo. Evidently the entire convention did not attend the ball game as the crowd is not as large as usual. The faces in front are quite distinct and readily recognized but those further back in the shade of the grand stand are very indistinct. It was a mistake attempting to take a photograph in that position. All should have been out in the full light. This should be borne in mind at future conventions.

VARIEGATED BANANA.—Messrs. G. R. Clark & Co., Scranton, Pa., send us a leaf of Musa ensete which is distinctly and strikingly variegated. The plant was one of a lot of seedlings raised this spring. They state that it has made a splendid growth this summer, but not so strong as the plain green form. They would like to know if any reader of the FLORIST has before seen or heard of a variegated Musa ensete.

FROST did considerable damage in the gardens of England, France and Belgium September 15 to 17. At Ghent in Belgium and Ussy in France the most serious damage was done, in the former ruining the bulk of the azaleas which were ready for market. The exportations of this plant will be very largely curtailed in consequence and prices will undoubtedly rule considerably higher.

CHRYSANTHEMUM PRIZE.—We are requested to state that the prize offered by Mrs. Benj. Harrison at the Indianapolis show is for the best six blooms of any seedling of American origin.

Catalogues Received.

Wm. Parry, Parry, N. J., nursery stock; Reading Nurseries, Reading, Mass. hardy plants; N. F. McCarthy & Co., Boston, auction plants; C. H. Murphy, Urbana, O., plants; Soupet & Notting, Luxemburg, Europe, new roses; C. E. Allen, Brattleboro, Vt., bulbs and plants; Dammann & Co., San Giovanni a Teduccio, Italy, seeds and plants; Herbert A. Jones, Himrods, N. Y., nursery stock; Nanz & Neuner, Louisville, Ky., bulbs and plants; W. H. Cassell, Canton, Miss., nursery stock; The Riley, Osborn Mfg. Co., Newark, N. J., metal jardinières, etc.; Fred W. Kelsey, New York, specialties in nursery stock; John Saul, Washington, D. C., nursery stock and plants; E. B. Jennings, Southport, Conn., plants; Chas. Eble, New Orleans, plants; Michel Plant and Seed Co., St. Louis, plants, bulbs and seeds; A. T. Merrick, Chicago, engravings for florists.

Coming Exhibitions.

November 5-8, Chicago.—Chrysanthemum Show Chicago Florist Club.

November 5-9, Indianapolis.—Chrysanthemum Show Society of Indiana Florists.

November 5-8, Montreal.—Chrysanthemum Show Montreal Florists' and Gardeners' Club.

November 6-8, New Haven, Conn.—Annual exhibition of the Chrysanthemum Club.

November 11-15, Detroit.—Chrysanthemum Show Detroit Florists.

November 12-16, Philadelphia.—Chrysanthemum Show Pennsylvania Hort. Society.

November 12-14, Boston.—Chrysanthemum Show Mass. Hort. Society.

November 12-14, Orange, N.J.—Chrysanthemum Show New Jersey Floricultural Society.

November 12-16, Cincinnati.—Chrysanthemum Show Cincinnati Florist Club.

November 13-14, Worcester, Mass.—Chrysanthemum Show Worcester County Hort. Society.

November 14-16, Springfield, Mass.—Chrysanthemum Show Hampden County Hort. Society.

On Seed Trade.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. MCCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1899.

RED ONION SEED is said to be less than a usual crop.

TIMOTHY SEED at \$1 per bushel in some parts of Iowa.

MR. WM. MEGGAT will make a western trip the end of this month.

ONE KANSAS FIRM is said to have 50,000 pounds of sunflower seed.

PEA AND BEAN growers insist that the crop is not equal to the average demand.

MR. HENRI MARTIN, with Vilmorin Audrieux & Co., and Mr. C. E. Osman, of London, have just made a trip through the States.

NORTHUP, BRASLAN & GOODWIN Co. at Minneapolis, have re-arranged their establishment, providing a much larger retail salesroom and handsome first floor offices with plate glass windows and electric light.

New Notes.

WOONSOCKET, R. I.—E. A. Chipman has made an assignment.

NASHVILLE, TENN.—J. C. Walker has retired from the florist business.

DETROIT, MICH.—A receiver has been appointed for Stayner & Kerr, florists.

FORT SCOTT, KAN.—Alma S. Patterson has completed a new rose house 12x48.

CLEVELAND.—A. Graham has built two new houses, one 100x24 and one 100x11.

CINCINNATI.—Frank Huntsman has been very ill, but is now on the road to recovery.

ST. LOUIS.—Fred. C. Weber has built a conservatory in connection with his new store at 3134 Olive street.

OMAHA, NEB.—E. C. Erffing has retired from the florist business. He is succeeded by A. Hooze, formerly of Hooze & Jensen.

EVERGREEN, ALA.—There will be a conservatory 18x40 in connection with the Evergreen Hotel, now being built here.

DETROIT.—The florists of the city have decided to give a chrysanthemum show at the Detroit rink November 11 to 19 next.

RICHMOND, IND.—Beach & Co. are building three new houses 75x12 and arranging to heat their place with steam. Hill & Co. are building two large houses.

PITTSBURG.—A "Century Plant" is in bloom at the conservatories of Mr. Wm. Darlington. The flower stalk is 29 feet in height and bears 1,551 flowers and buds.

MALDEN, MASS.—E. D. Kaulback is building two new houses 100x20 and putting in a 40-horse power boiler, intending to heat his plant of six houses by steam.

KANSAS CITY.—N. S. Griffith, the Independence florist, has opened a cut flower store at 1022 Main street, this city. He will conduct both a retail and wholesale trade.

MILWAUKEE.—A Klokner & Co. have opened a floral establishment at 215 Second street, and F. Schmeling one at 90 Wisconsin street and another on Reed street.

RIDGEWOOD, N. J.—Henry Hales is rebuilding his greenhouses and putting in a locomotive boiler for heating. Andrew V. D. Snyder is building a new greenhouse 80x16.

COLUMBUS, O.—The ladies' committee of the Old Ladies' Home will give a chrysanthemum display in the old Board of Trade room, City Hall, the first week in November. The Franklin Floral Co. will supply the plants.

SPRINGFIELD, MO.—C. Draper & Son have succeeded S. H. Horine as proprietor of the Springfield Floral and Seed Co. They will enlarge the greenhouses. Cut flower trade here is improving year after year, but prices are low.

WESTERVLY, R. I.—S. J. Reuter is building a propagating house 100x90. He has taken out five cast iron steam boilers and replaced them with one 50-horse power horizontal tubular boiler, and intends to put in another of same size.

KANSAS CITY.—Articles of incorporation of the Probst Brothers Floral Co. have been filed in the recorder's office. The capital stock is \$40,000. The incorporators are Herman Probst, Gustav Probst, Thomas J. Conn, Samuel Murray, Joseph Haefner and Henry Mills.

LAKE GENEVA, WIS.—The Button Bros. in the trade here are probably the most youthful florists doing business on their own account. They started into business three years ago at the ages of 18 and 16 years respectively. They are doing a fair business which is increasing annually.

INDIANAPOLIS.—There was an excellent display of plants and flowers at the Indiana State Fair. Chas. Riemann received first premiums for new show design and for ferns, caladiums, etc.; Bertermann Bros. for funeral design, basket, bouquet, cut flowers and general display of plants; Mrs. H. Hilker for cut gladioluses and roses; Jens Larsen for handle basket.

LA CROSSE, WIS.—Henry Kienahs & Son are building a large rose house and making other extensive improvements. Aug. Rimmer contemplates building two houses 150 feet long to be devoted to the growing of bedding plants. The cemetery association have made some improvements in their greenhouses. Their stock of roses for cut flowers is one of the largest, healthiest and finest that was ever grown in La Crosse greenhouses.

DETROIT.—The exposition was a great success in every way. The plums, late pears, apples and peaches were very fine; early fruit was past its best, grapes were poor. Cut flowers were scarce owing to the unfavorable season. Vick of Rochester, made a fine exhibit of gladioli, dahlias, asters, zinnias, etc.; plants in bloom were scarce; palms, ferns, etc. were well represented; S. Taplin carried off the bulk of the premiums in the latter class.

PITTSBURG.—Cut flower business was light through September. October opens up well with several weddings in the first half of it, and prospects for the winter are good. As usual at this season of the year good flowers are scarce now; no violets, no lilies, and not many carnations. A very large number of elaborate floral tributes were used at the funeral of Capt. W. R. Jones, manager of the Edgar

Thompson Steel Works, October 3. Several very handsome original designs were arranged by Jno. R. & A. Murdoch.

LANSING, MICH.—The 41st annual State Fair closed September 13, after five days of success. Mr. Knapper, gardener at the Agricultural College, made a fine display of palms and stove plants; his seedling coleus were especially fine and were the admiration of all. R. Mann & Son made a large display of plants and cut flowers, taking nine first and one second premium. Mrs. Sarah Smith, of Grand Rapids, made a good display of cut flowers, but came too late to compete for premiums. H. F. Dew has rebuilt his greenhouse and will put in steam.

WILMINGTON, DEL.—At the Wilmington fair, in the cut flower class J. L. Brown & Co. received seven first premiums and three seconds; M. F. Hayden four firsts and three seconds; Geo. W. Brown & Son one first; J. N. Lewis & Bro. one second; G. W. Brinton & Son three firsts and one second. In plants G. W. Brinton & Son received seven firsts and two seconds; J. L. Brown & Co. nine firsts and five seconds; M. F. Hayden five firsts; J. N. Lewis & Bro. three firsts and seven seconds; L. E. Baylis two firsts and six seconds; L. E. A. Greenleaf two seconds.

M. B. FAXON,

BOSTON, MASS.

Inter-State Fair at Elmira, N. Y.

Two weeks back I attended the Inter-State Fair held at Elmira, N. Y. I was glad to see that horticulture was well represented there. Mr. G. P. Rawson had quite a nice display in a prettily arranged booth, with which he took ten first and four second premiums; Mrs. H. D. Wells had a number of very good designs and made a large display taking two first and nine second premiums; the other prizes were taken as follows: Mrs. E. C. Palmer one second; Mrs. Asa Elliot four first, one second; Mr. J. F. Griffiths three first, two second; Mr. F. J. Kennedy three first, six second. The plants were not generally first class, but as good as could be expected considering the fact that they had to be kept in the building two weeks.

Mrs. Carney Compton got a \$100 prize for best decorated booth using grain in the straw for the decorations. This liberal premium should have brought out lots of competition, but there was only the one exhibit.

I think the idea of having a horticultural department in connection with agricultural fairs should be encouraged by florists making a good display. They are held pretty well all over the country and attended by great numbers of people who have not the opportunity of seeing the large horticultural exhibitions held in larger cities, and no doubt many of them would become future customers of the florists. J. B.

Great Destruction of Plants by Frost at Ghent.

We regret to learn from Ghent that the nursery trade there has for the moment been almost paralyzed through a sharp frost September 16, which has committed terrible havoc among the azaleas. The frost came on about 2 o'clock on Monday morning, and by daylight it was apparent that a most irreparable loss had been sustained. Thousands upon thousands of beautifully grown plants present the appearance of having been scorched by fire, the hot sun, following so quickly after the frost, developing the injury quicker than if the weather had been dull. Packing operations for export were to have commenced in earnest on the very day of the disaster, and the disappointment to the customers will be great. The loss to the growers will prove the most serious misfortune that has befallen them within the recollection of the oldest horticulturist in Ghent. — *Gardening World*.

Caution.

I wish to warn my brother florists against an individual giving his name as James Pendergast and representing himself as having been a rose grower for me. No such man has ever been in my employ. I have had several queries in regard to him, the last two from Colorado which I enclose. His having gone to the trouble of having cards printed bearing my name leads me to believe that he is attempting to impose upon those in the trade where he happens to be and possibly to perpetrate some swindle. I would feel obliged to anyone who will furnish me particulars about him.

Sus. mit, N. J.

JOHN N. MAY.

[The printed card which was enclosed read: "James Pendergast, Summit, N. J., Rose grower for John N. May."]

for Florists' Stock is now ready and will be
 mailed to all applicants.

MICHEL PLANT AND SEED CO.,
St. Louis, Mo.

PANSIES.

QUALITY HIGH.

PRICES LOW.

I attend personally to selecting the finest specimens only, for my seed bed, trying the various
 novelties and discarding those without special merit. Growing seed enough only to produce what
 plants I sell, I can make a finer selection than if grown in quantity.

From the sale of over **100,000 Plants** last season I have received numerous
 recommendations. Not one complaint.

PRICES: Good stocky plants from seed beds, 75 cents per 100 free by mail, \$5.00 per
 1000 per express. Send for circular.

ALBERT M. HERR, Lock Box 338, Lancaster, Pa.

My Pansies are all from my own Seed Stock which I selected with most scrupulous care as to size and
 coloring. The varieties are in the proportion as indicated by the figures.

TIMARDEAU	7	STRIPED	1
PANSIES	5	BLUE	1
HIGNOT	2	WHITE	1
SE-PLUS-ULTRA	1	GUFF	1
GIANT SHOW	2	DARK SELFS	1
ROYAL DEBARS	2	RED, FINE	2

The collection can be furnished each separate, but in above proportion only 20 cts. per 100; \$5.00 per 1000.
 In complete mixture 60 cents per 100; \$5.00 per 1000. If by mail add 60 cents per 1000.

DANIEL K. HERR, Lancaster, Pa.

REMEMBER—The seed I use equals any of the high priced or fancy strains, and is in more variety.

REMOVAL.

Friends will please notice that I have occupied my new
 printing house, which is ideally situated and fitted up for
HORTICULTURAL PRINTING, with treble my former
 facilities, and plenty of room for extension. I am now ready to give better satisfac-
 tion than ever on Catalogues or any printing for florists, from the basis of a thorough
 knowledge of both flowers and printing. **ADDRESS NOW**

J. HORACE MCFARLAND, Mount Pleasant, Harrisburg, Pa.

Montreal.

The chrysanthemum show to be given by the Florists' and Gardeners' Club will open November 5. In addition to the "mums" there will be exhibits of orchids, roses, carnations, etc. We have decided to adopt the bank system of staging and expect to have about twenty banks 4 x 10 feet each in addition to spaces for the dozens, half dozens and single specimens.

The September show of the Montreal Hort. Society and Fruit Growers Association of the Province of Quebec was a total failure as far as the display of plants and flowers was concerned. There is much dissatisfaction on the part of the gardeners and florists on account of the too great prominence given the fruit interest at the expense of the floral display.

Wm. O'Hara, the St. Antoine street florist, has made an assignment with liabilities of about \$3,000.

P. McKenna & Son have given up their store on St. Catherine street but still continue plant and flower growing at their establishment at Cote des Neiges.

Joe Bennett has returned from his trip to Europe, he was given an ovation by the boys at the last meeting of the club.

In addition to the magnificent medal presented by Polman Mooy of Haarlem, Holland, to the Florists' and Gardeners' Club; the General Bulb Company of the same place, has promised two medals, all to be competed for at the March show of the club. Mr. Bennett has also offered \$50 for a collection of bulbs at the same show.

J. M. K.

Toronto.

A meeting for the purpose of forming a Florists' and Gardeners' Club was called for Wednesday the 2nd inst., at Jno. H. Dunlop's greenhouses and proved a very gratifying success; forty florists were present and all enrolled as members of the new club. The unanimous opinion prevailed that the Toronto Florists' Club from enthusiasm displayed was on a fair way to be a grand success, and wonder was that it had not been started before. F. G. Foster, of Hamilton, and H. Dale, of Brampton, graced the meeting with their presence and lent their aid. The first regular meeting will be held on Wednesday October 16, for the election of officers, etc.

The floral display at the Industrial Exhibition just closed was very creditable to the florists of Toronto, as a larger number of exhibits were made and the workmanship superior to any of the previous exhibitions, showing that we too are taking a step forward. Trade for this season of the year very good, principally funeral and wedding work. D

PRIMROSES.

A fine strain of Single Primroses, 4 inch pots, at \$5.00 per 100; 3 inch pots at \$5.00 per 100.

PRIMULA OBCONICA.

Strong plants, at \$1.80 per dozen.

HUGHES'

SOLUBLE FIR TREE OIL.

FLORISTS AND NURSERYMEN SHOULD
NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants: such as ferns, etc., if used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

Aqua Ammonia as a Fertilizer.

Is aqua ammonia a good fertilizer for pot plants and roses and carnations on benches? If so, how should it be used? H. S.

Aqua ammonia is a very useful fertilizer. It should be used in the proportion of half a pint to six gallons of water, a moderate watering once a week. When used for plants on benches it will be found most useful when the plants have made root freely and have partially exhausted the strength of the soil. When only cow manure has been used it supplies the element which that manure lacks, it acts very quickly, showing its effects in a week or two R CRAIG.

NEWPORT, R. I.—Florist Arend Brandt is arranging to give an exhibition of chrysanthemums November 13 to 16. It will probably be held in O. A. Fellows Hall.

Florist's Letters.

Emblems, Monograms, Etc.

These letters and designs are made of the best immortelles, wired on wood or metal frames, having holes drilled in them to insert tooth-picks, by which they are fastened to the design. Give them a trial. You will find these goods to be superior to any in the market. PAT'D AUG. 6, 1888.

NOTE—All infringers or imitators of the above letters and designs will be prosecuted to the fullest extent.

ADVERTISERS should bear in mind that the FLORIST is a strictly trade paper and that wholesale price lists may be published in its columns without fear that the wholesale rates there given will be seen by retail buyers. Subscriptions from those who are not in the trade are invariably refused by us. Among those in the trade we include employees of commercial florists and private gardeners who have charge of greenhouses.

IF YOU HAVE not personally reported to us the branch of the business you are engaged in and the number of feet of glass on your place, send it in at once so that you may be correctly classified in our new trade directory. Don't wait, do it now.

AN ADVERTISEMENT in the new trade directory we are now compiling will be a standing adv for at least two years.

Scientific Education for Gardeners.

This subject does not seem to lose its interest, and there is apparently no question as to its importance. The only question is, What is science? and that is an easy one, although not generally understood. Most men think science a degree in the scale of knowledge that is only conferred by some institution of learning, that scientific men possess knowledge not easily gained. This is a great mistake. Let us see what the definition of the word is:

1st. Knowledge; penetrating and comprehensive information, skill, experience and the like.

2nd. The comprehension and understanding of truth or facts; investigation of truth for its own sake; pursuit of pure knowledge.

3rd. Truth ascertained; that which is known. —Webster.

Certainly there is nothing occult about this. Therefore, popularly speaking, science means exact fact, or any theory that may be reduced to practice. Now Mr. Henderson's reference to the knowledge of rose growing (page 82) is a concise and clear definition of science. To that let us give an illustration. Some years since Mr. Henderson gave to the horticultural world a paper on the "Use of the feet in seed sowing," the most useful he ever wrote. To the many this announcement was an astounding theory, it completely upset all pre-conceived ideas of seed sowing. Many accepted his views at once, and followed his instructions, the result is, no gardener worthy the name thinks of sowing seed in any other manner. Experience has proven his theory a fact, a scientific fact, and he a scientist, because whoever adds to the knowledge that already exists, a fact not previously known, is a scientist; it matters not whether that man be a gardener or an acknowledged philosopher, the discovery of an important fact makes the discoverer a philosopher.

No one ought to question the importance of scientific knowledge or education for gardeners. The important question is, where can this be obtained? From books? no; from a college? no. We heartily endorse the importance of both, but the book is but the record of another man's experience, and in the college you only learn what is in the book. Where then shall the gardener or his sons look for scientific education? Taking it for granted he has a good rudimentary education the book for the gardener to study is the garden, all that is known or ever can be known is there, it is for him to find it out. Not one iota of knowledge about gardening was ever learned in any other place, however much the facts may have been disseminated after.

Whatever pursuit a young man may choose for a livelihood his first step is to inoculate his mind with noble, systematic thought. He should accept all other

men's views, all established customs with a respectful protest. The young gardener, while following to the letter all methods now in use, all accepted theories, all the knowledge that exists, should make the best application of them possible, then enter his educational course. Perfection in this life is "that gay tomorrow of the mind which never comes," there is ever something new to learn. Methods, appliances, in fact everything that relates to horticulture, whether in the cultivation of old forms or the development of new and greater forms, are susceptible of improvement. Progress is the watchword of the day, and horticulture keeps pace with all other industries. Thought systematically employed is the parent of science, and nowhere is there a wider or more interesting field for its employment than the garden.

No gardener, young or old, should be content with the present, but dwell in the future and assist in that perfection or development of forms which will never cease. Books will materially assist him, an interchange of thought, conversation with men of wide experience is essential, but the application of the human intellect, close observation and a clear discrimination united with indefatigable industry is the course of study for the young gardener to pursue in order to reach distinction.

C. L. ALLEN.

Floral Park, N. Y.

Fungous Diseases of Plants.

Various rusts, smuts, mildews, blights and similar diseases of cultivated plants have been generally known and dreaded since plants began to be cultivated. Any understanding of the cause of these troubles, of the conditions of their occurrence, and of their relations to each other and to the plants they infest is a matter of comparatively recent acquisition even among botanists. Among American farmers and gardeners it is only recently that intelligent inquiry and thought regarding these important sources of loss has been awakened, and they are but just beginning to be popularly spoken of as fungous diseases. With this increased popular interest has naturally arisen an increased interest in their scientific investigation, which is as yet but fairly begun, and in the practical application of our technical knowledge in devising ways and means for checking the spread and preventing the ravages of the pests. It is, doubtless, true that to the average reader the term fungus carries with it no definite idea. This is due partly to the newness of the popular use of the term and the meagreness of generally accessible sources of information concerning the fungi, and partly to the inherent difficulty and technicality of the subject. To obtain a clear notion of organisms so small as to be barely recognizable by the

naked eye and requiring high powers of the microscope for their study, yet with such apparently disproportionate capacities for mischief, is not easy. It is, for this very reason, all the more important that, in a discussion of fungous diseases intended for popular information, an attempt should be made at the outset to remove, so far as may be, this fundamental difficulty.

In the first place, then, a fungus is a plant, as truly and essentially a plant as the corn stalk or rose bush on which it grows. Yet it is not only much smaller, but also much simpler than these. While the plant body of the corn or rose shows much specialization of structure, having the various vegetative functions of the plant performed by distinct organs, the root, stem and leaves, very many plants show no such specialization, but have all their vegetative functions performed by the whole plant body, which then needs no variety of organs. Of the latter class of plants are the rock weeds and sea mosses, the fresh water pond scums and the fungi, which are obviously much simpler and more primitive plants than those with roots, stems and leaves. In all true fungi the plant body consists of numerous simple or branching white threads which spread over the surface or through the substance of the object on which the fungus grows. These threads constitute the so-called mycelium of the fungus, and are comparable with the more elaborate plant body of other plants, since they perform all its vegetative functions.

Equally important with its own healthy growth is the provision by any plant or animal for the perpetuation of its kind, and to this end it develops organs of reproduction. In many of those plants provided with root, stem and leaf, these reproductive organs are grouped into a structure called a flower, and such plants are known as flowering plants. They all produce, by the further development of certain parts of their flowers, structures known as seeds, which can, under favorable conditions, develop into new plants similar to that which produced them.

Fungi do not produce flowers, and they vary greatly in their reproduction, but they all agree in producing bodies called spores, much simpler than seeds, as would be expected, but analogous to seeds in their ability to develop, under favorable conditions, into plants similar to those which produced them. These spores are usually produced on special fruiting or reproductive threads which grow from the vegetative threads of the mycelium of the fungus. The reproductive threads may remain separate, thus producing their spores free in the air; or they may become interlaced or consolidated into a complicated fruiting structure, on which the spores are produced either superficially or in cavities from which they finally escape into the air. The spores of fungi, being so small and light, are readily taken up and widely spread by currents of air, and are easily carried by insects from plant to plant. In such ways a fungous disease may spread from a single insignificant case until it becomes epidemic over a large area.

In the course of its life-cycle the ordinary flowering plant passes from the seed, through the seedling, to the adult plant bearing flowers and then seeds like that from which it grew. Many of the fungi, however, pass through a much more complex life-cycle, during which a given fungus may produce several kinds

of spores and assume several forms so unlike each other that they can be recognized as different stages of the same plant only by careful, patient cultivation and study. It is convenient to select some one stage of such a variable fungus as its perfect or adult form, and it is natural and logical to regard as such that stage in which the fungus shows the greatest elaboration of structure, while the simpler stages through which it passes are commonly called imperfect forms. This tendency of fungi to variety in form, or pleomorphism, as it is called, greatly increases the difficulty of their study and complicates those problems which concern the successful combating of fungous diseases.

A question which very naturally suggests itself is: Why do fungi attack and cause diseases of other plants, instead of living independently? This question involves matters of the greatest interest and of fundamental importance and significance. It is well known that all green plants owe their characteristic color to the presence of a definite pigment known as leaf-green or chlorophyll, which is so generally present among the higher plants, that to most minds the very word plant carries with it the idea of greenness. Now the possession of chlorophyll is the pre-eminent feature which gives to plants their all-important place in the economy of nature. No living thing can continue to live on inorganic substances, but all require as food some of those materials of comparatively complex chemical composition, known as organic substances. The materials furnished by the earth, the air and water are all of simple composition and unorganized, but in leaf-green we have the connecting link, the means of bridging the interval between the inorganic and the organic. We need not here discuss the process in detail. It is sufficient for our present purpose to say that in Nature's laboratory of the leaf, some of the simple constituents of air and water are combined, by the action of leaf-green in the sunlight, into the complex organic compounds which serve the plant as food. The chemistry of this remarkable process is not well understood, but the commonest permanent form in which these food materials appear is that of starch.

Now, as was noticed above, the threads of the fungi are white, uncolored; that is, they contain no leaf-green. Consequently the fungi can not elaborate their own food material, but must obtain it ready elaborated from some other source. Evidently the available sources of organic food supply fall under two heads, living organism and dead organic matter, commonly decaying. And on this basis we may divide the fungi into two classes, those which derive their nourishment from other living things and those which live on the remains of dead organisms. The latter, known as corpse plants or saprophytes, include the moulds, toad stools and many other fungi. But the first named group is that which at present interests us, since it contains the various groups mentioned at the beginning of this sketch, which live on or in the bodies of other living plants at their expense, and cause extreme weakening or even the death of the affected plants. Such fungi are known as parasites, and the plants they attack are called their hosts. This distinction between saprophytic and parasitic fungi is a very useful one, but no sharp line can be drawn between the two groups, since some fungi seem to be able to live either as parasites or as saprophytes, while it is probable

that very many pleomorphic fungi are parasites in some of their forms, and saprophytes in other stages of their life-cycle.

Finally we may notice the interesting fact that any given parasitic fungus is usually restricted in its capacity for harm to a single host plant or to a few closely related ones; though, on the other hand, closely related fungi may attack plants of widely different relationships. Thus the mildew of the lettuce and that of the onion are very closely related fungi, yet neither mildew can attack the host plant of the other, since the structural resemblances are few and the relationship remote between the lettuce and the onion.

From the above facts we may derive a few important principles for our guidance in attempts to avoid or check the ravages of fungi among plants cultivated for use or beauty. Since the mycelium of a parasitic fungus grows usually within the tissues of its host plant, it is too late to try remedies after a plant is once infected. It is true that a few fungi are superficial in growth, and a treatment may perhaps be found which shall destroy such parasites without harm to the host. But in most cases our aim must be to fortify exposed plants against infection by the timely application of protective solutions or mixtures, which shall prevent the germination of the spores which fall upon the plant so treated. Some progress has been made in this direction and some results have been reached which justify hopes of ultimate general success in largely avoiding the present enormous annual losses resulting from fungous diseases.

The treatment which now gives promise of most general applicability and efficiency is the spraying of the plants with a solution of sulphate of copper (blue stone) or with one of the preparations in which it is the important ingredient, known as Eau celeste, Bordeaux mixture etc. It seems very possible, too, that plants may be fortified against the attacks of parasitic fungi, or their susceptibility to such attacks be largely diminished, by special fertilization, for the purpose of introducing into the plant substances which, while not interfering with its growth, shall make it a less congenial soil for the growth of fungi. The line of investigation here suggested has not yet been followed out, although it offers an opportunity for chemo-physiological work which may yield important results. It is obvious also, that a vigorously healthy plant will resist the fatal influence of parasites far better than a poorly nourished one.

Much may be done, after a plant is too far gone to be saved, to prevent further spread of the disease, by removing and destroying the diseased parts. It is not sufficient, however, to throw the portions removed into the rubbish heap; the spores must be actually destroyed and this can be effectually done only by burning. A considerable number of fungi produce, in the plants on which they live, resting spores which ordinarily remain on or near the ground in dead leaves or stubble, survive the winter and, germinating in the spring, infect the new growth. In these cases the danger of a severe attack in the following year can be greatly lessened by clearing up and burning all such sources of infection.

Numerous instances can be cited of more or less common weeds or wild plants so closely related to certain cultivated plants that they are liable to the attacks of the same fungi, and so serve to perpetuate those fungi and to infect

BED OF PALMS AND LIKE DECORATIVE PLANTS

the related cultivated plants when growing near. Evidently, then, such plants should be carefully and thoroughly exterminated wherever they may prove a source of danger.

We may pass now to the application of the foregoing facts and principles in the consideration of a few particular fungous diseases.

THE BLACK SPOT OF ROSE LEAVES.

Actinonema rosae Fr.

In December, 1887, my attention was called by Prof. S. T. Maynard to a disease which considerably affected the leaves of roses cultivated in the Durfee Plant House, and which he desired me to investigate. The leaves presented all the external characters usual to the disease which examination showed to exist, namely, the so-called black spot, caused by a parasitic fungus known as *Actinonema rosae*.

This is probably the commonest and most troublesome disease of cultivated roses, whether of outdoor or greenhouse cultivation, in both Europe and America. It first appears in the form of dark discolorations of the upper surfaces of the leaves, which spread outward and often show a yellow band surrounding the dark spot. Often the discoloration begins at the tip of the leaf and spreads downward. The centers of the spot frequently become dry and brown, indicating the complete death of the tissue. In consequence of the attack of the fungus the leaves fall from the stem and may be replaced by a new crop if the weather be favorable. The loss of the functional activity of the leaves at a time when their work is most needed, not to mention the waste involved in producing an extra investment of foliage, must greatly weaken the plant and lessen the amount and vigor of its bloom, as well as seriously impair the ability of outdoor roses to resist the following winter.

The mycelium of the fungus develops in the leaf, chiefly just below its surface

layer or cuticle. From this principal mass threads penetrate deeper into the interior of the leaf and absorb its fluids for the nourishment of the fungus. Other threads grow upwards and produce the spores which, as they grow, make room for themselves by forcing up the cuticle, which finally bursts open, allowing the ripe spores to escape through ragged openings. The spores germinate promptly on a moist surface and readily infect fresh leaves. It is probable that this parasite of the rose is merely an imperfect stage in the life history of a fungus, whose perfect stage is very probably, or at least possibly, saprophytic and serves an important purpose in carrying it through the winter. In the lack of definite knowledge on this subject, however, we can deal only with the parasitic or *Actinonema* form.

In combating the disease it is essential to begin early, for leaves once penetrated by the mycelium of the fungus are irretrievably lost. All efforts must be directed toward preventing infection, by the application of some protective compound. For this purpose it is recommended that the bushes be sprayed shortly before the unfolding of the leaves, again as soon as they are fairly opened, and at intervals of three or four weeks until the flowers begin to open, especially after heavy rains which may wash off the protecting substance from the leaves, with blue water or Eau celeste, prepared as follows:

Dissolve 1 pound sulphate copper in 4 gallons warm water;
when cool add 1 pint commercial ammonia and 13 gallons water.

Any leaves on which the spots may appear should be promptly cut off and burned.

When the autumn is long and mild plants which have lost their leaves from black spot during the summer often put out fresh shoots from the terminal buds of their branches. This process exhausts the plant and lessens its ability to with-

stand the winter, and should be prevented by clipping off the terminal buds, leaving those lower down to make the next season's growth. There is no advantage in spraying the already affected plants in summer and fall, but the "spotted" leaves should be collected and burned as they drop, to prevent further mischief as far as possible.

JAMES ELLIS HUMPHREY,
Prof. of Vegetable Physiology, State Agricultural Experiment Station, Amherst, Mass.

Bed of Decorative Plants.

Our illustration is from a photograph of the large bed of decorative plants mentioned by Mr. Whittle in his article on page 90 of the October 1 issue.

It was to be seen the past summer on the grounds of Mr. H. S. Leach, at Saratoga. The bed is oval in shape, 30 x 20 feet in size and contained about 150 palms, agaves, pandanus, marantas, crotons, aspidistras and similar plants as a central group, encircled by a like number of fancy caladiums, the whole bordered by a double row of a white and green coleus. The tallest plants in the central group were from six to eight feet in height.

The bed was designed and planted by T. J. Totten, a florist of Saratoga Springs, to fill Mr. Leach's order for something handsome and at the same time different from anything his neighbors had. The bed was most satisfactory, and was beautiful all summer.

Cockroaches.

In the notes on Mr. Kimball's orchids I notice that Mr. Savage is very much troubled by cockroaches, and that he traps them in bottles with sweetened water. I think that if he tries my recipe he will find that he will not be troubled with them much longer.

At one time our propagating house was overrun with the pest, and do what we would, we could not get rid of them until the happy thought came to me to try sugar and paris green, and I found that it was an effectual dose for them. They were completely banished and we have not seen any live ones in that house since. It kills them all out in about two weeks. I have gathered up from fifty to one hundred dead insects of a morning, and when we tore out the benches a short while after we found hundreds of them that had crawled away and died.

I used one cup of granulated sugar and one tablespoonful of paris green, mixed it dry and laid it around on pieces of broken pots, on the benches, also under the benches, in fact any where that I thought they would be likely to run.

Flatbush, L. I. GEO. E. BENNETT.

New Jersey Notes.

A recent visit to Mr. Nash's nurseries at Clifton, N. J., was more than repaid by a sight of his Beauty houses. He has four houses devoted to this variety, comprising some 3,200 plants, and at time of writing they are in splendid condition, the finest the writer has seen for some time. The houses are the regulation style of sloping benches; it is quite noticeable that the plants on the higher of the middle benches are stouter and more vigorous than the others. The proportion of long-stemmed buds is in excess, a matter of much moment in producing good market flowers.

As for the question of blind wood versus flowering stock for cuttings, one bench to be seen here was planted with stock raised from flowering wood of the highest quality—the stems of first quality flowers. The plants were healthy, but had not made nearly the growth of most others—were much smaller. We must, however, remember that in most cases the wood from these stems was quite hard, and perhaps too ripe to strike very vigorously.

Among other roses at this place, Brides were especially worthy of note, showing a tremendous quantity of flowering wood; the same may be said of Bennetts. Mr. Nash does not grow any large roses except the Beauties, but he expects a good thing with them. Mermets and La France looked well, the latter breaking very vigorously.

At Mr. H. E. Chitty's place at Paterson, N. J., a wonderfully fine bed of La France was noted, which during the month of September produced some 2,000 blooms. In cutting the flower stem is cut down right to the stock, inducing more vigorous growth from the bottom. Wherever the shoots on these plants are tied down there is a continual line of breaks. These plants were in their second year; there seems little doubt that the La France and a number of other roses make finer flowers from the second year on. Some Bennetts seen here in their fourth year left nothing to be desired in either color or size.

EMILY LOUISE TAPLIN.

How to Ship Rose Plants.

In the first place comes the selection of the plants; this should be done with great care, we should pick good healthy plants of a uniform size as near as possible, so when they arrive at their destination there will not be some large ones and some small ones, because the large plants will make the smaller plants look smaller than they really are and therefore give dissatisfaction at the start. Next, the plants should be well watered, say two hours before packing so they may be thoroughly wet and also nicely drained so as not to be entirely mud. Of course good judgment is to be exercised at all times and the plants watered according to the length of time they are expected to be on the road.

Then comes how to pack. This of course entirely depends upon the state of weather and time of year, but whenever it may be, the object to be attained is, in what condition will the plants be when they arrive at their destination, for what does it matter to the consignee how fine the plants were when packed if they should get broken or damaged in any way in transit through the fault of poor packing, and this should always be borne in mind.

If plants are to be packed in the winter at a mild time when the temperature does not get below 20° frost, I think most any ordinary box will do to pack in, but if it is longer than three feet and wider than two feet, it should not be deeper than six inches in the clear, and if boxes were to be made expressly for packing I think a good size would be three feet long, two feet wide and six inches deep. Perhaps this one would answer well for 3 inch pot plants, while a box two feet long, eighteen inches wide and six inches deep would do for 2 inch plants. The box should be well lined with paper, most any kind will do, we might say three thicknesses of newspaper, then a thickness of cotton, then two or more thicknesses of paper. This will do for ordinary winter weather, of course if it is colder we should line our boxes accordingly and bear in mind also the part of our country the plants are to be shipped. The plants should then be well wrapped in paper and placed firmly in the box, but do not squeeze enough to break the ball or the foliage, and I think a little excelsior placed between the layers helps to protect the foliage and to keep the layers nearer level.

If plants are to be shipped in weather too hot to admit of their being packed tight, then of course to insure their traveling safely they have to be packed upright so as to allow free circulation of air about the foliage. In shipping a long distance it would be a great saving in express charges to have the box deep enough to allow the nailing of narrow strips over the top, so the box could be rated as a closed box, as on all open boxes of plants the expressage at present is double rate. If plants are to be packed as just stated they should have a strip the exact size to fit in the box and placed just above the ball, as often as two or three rows; a nail can be driven in to the strip from the outside of the box to keep it in its place. This prevents the plants from dropping out should the box get turned wrong side up.

In packing plants in an open box, should the neck of the plants be quite long they can be placed two tiers high, so that the ball of the upper tier can rest on two balls of the lower tier between the plants, and they will thus travel well. But if the plants have a very bushy appearance with a shoot or shoots quite close to the ball I would advise only one

tier in the box, as two tiers would be apt to injure the young shoots.

If plants are to be shipped across the country to the Pacific Coast, perhaps in consideration of the high express rates, it would be best to wash the soil nearly off the roots, wrap wet moss around them and dry moss or excelsior around the foliage, wrap in paper in medium size bunches, say fifty plants to each and place firmly in box made light as possible consistent with strength.

If to be shipped across the ocean the box should be quite strong with holes bored in the sides to allow as much air as possible to pass to the foliage, the balls can be wrapped in wet moss to prevent their drying out, then place a row against the end of the box with a strip against the edge of the ball to keep them in their place, the same process can be followed at the other end. Each box thus shipped should be plainly marked, "Please do not place near boiler," as many a fine case of plants has been ruined on steamships.

An invoice should always be sent with the plants. I think it a good plan to send a duplicate invoice of the number of plants in the box with the plants, so the person who unpacks them knows exactly how many there are and the number of each variety before he begins and it will help him very much. The original invoice of course can go by mail and will probably reach the consignee before the plants do. I once read an article on "business methods," and it was there recommended to send an invoice two or three days before the plants were shipped, but I do not think it a good plan as in our business we do not always know just how much of the order we can fill with their respective sizes, varieties, etc.

Upon the receipt of an order for plants I would recommend the immediate shipment of same (unless of course there are directions to the contrary), as it is a characteristic of American people when they make up their mind to have a thing they want it immediately, and I do not think florists are any exception to the rule, so the sooner the order can be shipped the better satisfaction it will give. If it can be shipped the next hour after received so much the better.

How may we ship? I will say most decidedly by express; although the charges are very high, I think it pays far better in the end and certainly gives better satisfaction. There may be times when it will do to ship by freight a short distance, but as the general thing express is the proper way.

LYMAN B. CODDINGTON.

[Read at a meeting of the New Jersey Florists' Club of Summit, N. J., September 19, 1899.]

Rose Duchess of Albany.

No rose of any class has so suddenly bounded into favor in the New York market for many years as this new candidate for patronage. Its lovely bright clear color and sweetness combined with a good shape, size and stiff stem all help to make it at once the ideal rose with all who see it.

This variety is a sport from La France, but is far superior to that old favorite in every way. Under the same conditions in every particular, it will produce larger flowers and more of them, of a clear color at least ten shades deeper than La France and without the pale tint on the back of the petals as in that variety. "Albany" as it has already become known (without the handle), is the favorite with all to-day and takes first honors with all hands.

JOHN N. MAY.

NEW POLYANTHA ROSE, CLOTILDE SOUPERT

Pale Color in Perle Buds and Others.

The cause of this is largely due to continued cloudy weather in conjunction with either extreme moisture or dryness at the root. In very cloudy weather, particularly at this season of the year, if the plants are on the dry side at the root they very rarely show it on the surface of the soil till the sun begins to shine again, and under such circumstances plants often receive a partial check, and the flowers or buds being the most sensitive part of the plants are the first to be affected thereby. On the other hand if it should happen that a little extra water should be given just before a

cloudy spell sets in the same result would follow, as the plants would have more moisture than they could properly utilize, and it would first affect the buds. This often occurs at this season of the year when the plants have in reality more food than they can properly assimilate, from the fact that the roots have not yet fully occupied all the soil surrounding them. In other words the plants have too much food to digest and the flowers become slightly bilious in consequence.

It may appear somewhat confounding to some to lay the blame for the above to two very opposite causes, yet I have seen it occur frequently under either condition, and it is here as in all other

matters appertaining to the business that the small details are often the most important. Plants like animals need constant and regular attention and should never be overfed or kept hungry for any length of time, should be kept clean, have all the pure air possible consistent with the conditions most suitable for their full development, kept in a nice growing atmosphere—not hot enough at night to make the buds come small or weak in the stems, or so cold in the daytime as to give them a chill and cover them with a blanket of mildew.

As the days shorten it will pay the grower to remember that to obtain the best results from roses a night temperature of 56° to 58° for most all varieties of teas suits them best, and as soon as the sun begins to shine on the house in the morning and the temperature rises to 66° or 68° at most, begin putting on air, very little at a time, till by the middle of the day with a bright sun a liberal amount of air will be circulating all through the house. With the ventilators properly attended to 80° to 85° will never hurt roses in the middle of the day from bright sunshine, but do not attempt to get over 70° by fire heat under any circumstances by day. Water early in the day, this will allow all surplus moisture to dry up before night and avoid much trouble with black spot. Where Bennetts are grown, if desired the night temperature may be kept at 58° to 60° by day as above.

JOHN N. MAV.

New Polyantha Rose Clotilde Soupert.

Our illustration shows a few blooms and buds of this new polyantha which so favorably impressed our correspondent E. G. H. when abroad, and which he described on page 62 of September 15 issue.

A Chicago florist received a dozen small plants in 2-inch pots about June 1. They were grown on and planted out on a bench about September 1 and are now 12 to 15 inches high and blooming very profusely. The flowers are large, very double and well formed, round at first but flattening as they expand; the outer petals are pearl white shading to a center of fine rosy pink, both pure white and pink flowers appearing on some of the plants.

The grower of the plants seen states that the flowers are very persistent and thinks that they will be of considerable value to those who retail the flowers they grow, while its great and unquestionable merit is for bedding and as a pot plant.

If you have anything to sell to florists, nurserymen or seedsmen, advertise it in the AMERICAN FLORIST and you will find a buyer if it is a salable article.

If you have any trashy stuff you want to sell don't advertise it in the FLORIST, but if you have a good article and want to sell it at a fair price you can find buyers by advertising in these columns.

New Jersey Notes.

H. E. Chitty, of Paterson, N. J., is much interested in carnations, as may be inferred from his communications to the *FLORIST*. At time of writing he has a bed of Grace Wilder which are as exceptionally fine in the way of carnations as Mr. Nash's Beauties are among roses. Viewed from the end of the house they present an apparently solid mass of buds and flowers, as deeply colored as this variety can be. There are no pale, off-color flowers to be seen, nor are they irregular in shape; in fact, the bed is as near perfection as one could wish. There is no other pink carnation that can take the place of Wilder; it is always called for, though very often during the winter we see a good many off-colored flowers.

Among whites, Mr. Chitty's Hinze's White are certainly fine, good color, good shape and most prolific, yet compare these flowers with L. L. Lamborn, Silver Spray or Silver Lake and they are decidedly yellow. Silver Lake is, I believe, of recent introduction; this is its first trial with Mr. Chitty. It is somewhat in the style of Silver Spray, and is noticeable for its extreme whiteness. Lack of experience prevents any further testimony as to its excellence.

West End is a new carnation from Massachusetts, the color is strikingly like the American Beauty rose; its introducer says the tint is identical by artificial light. It looks like a very nice thing; Mr. Chitty is making his first trial of it this season. Much the same color, but lighter, is W. P. Simmons' Tidal Wave, a very fragrant variety.

Mrs. Carnegie, white with deep pink stripes, seems about the most popular of the striped varieties. Many—in fact most—of the fancy carnations find slow sale in the New York cut flower trade; they are called for in small quantities, but never compete with self-colored varieties.

Among crimson carnations Clifton and Orient are certainly the best. Crimson King is now quite out of date, because though very prolific, the flowers are literally without stems. Anna Webb is a good color, but it does not last; in fact, all crimson carnations are deficient in this quality. Orient is the most lasting and a good flower, but Clifton is usually larger.

Mr. Chitty never plants his carnations outside two years in succession in the same place. A good deal of his success may be imputed to this, and his system of pruning, mentioned on page 86 of the *FLORIST*, certainly does result in wonderfully stocky, vigorous plants.

EMILY LOUISE TAPLIN.

Soils for Carnations.

Mr. Swayne at the Buffalo convention stated that heavy soil was preferable for growing carnations in during summer.

My experience fully coincides with that of Mr. Swayne. Yet the past summer teaches the lesson that this statement also must be modified. The older we grow the more do we become convinced that there must be an extensive latitude given to all our "rules" for the

growing of plants. Observation and experience teach us that rules always have exceptions. We may have two houses planted to one variety of roses—treated exactly alike—yet seldom would both be seen exactly in the same condition.

The ground here upon which carnations are grown is a clay loam, with blue clay sub-soil. Carnations growing in this soil usually find it congenial and generally become very fine plants when the time arrives for lifting and planting in the greenhouses in the fall. But this summer's experience in regard to the weather has proved that heavy soil here is not good for carnations during prolonged wet weather. This soil is exceedingly retentive of moisture; and during a dry season if the soil receives frequent hoeings the plants thrive well, never showing signs of suffering in seasons of drought. But this year the continual rains have made the ground absorb and hold water like a sponge, to such a degree that the carnations were growing during most of the summer in ground not much drier than a mud puddle.

Naturally the plants succumbed under such untoward conditions. Growth nearly ceased in those which lived, and each week witnessed the total collapse of many. So that in order to save what were left it was decided to take up the living plants and remove them to the place prepared for them in the houses. This was done during the second week in August. The result has been entirely satisfactory. The plants have quite recovered from their weakened condition, are now full of buds and showing promise of good things to come for the winter.

A rather limited observation of other florists' carnations shows that these grown this year in light soil are in the finest condition. Those grown upon the sandy soil of Long Island look splendid, and are considerably better than those found here.

No doubt if heavy soil is thoroughly drained such disastrous results as stated above will not follow. For in that case the water would not be retained by the soil, and the roots of the plants have a better chance to live and do their work. Whether these losses upon heavy soil are general this year is not known to the writer. Perhaps the experience may be different in those localities where there is a heavy loam with other sub-soil than clay.

But there also seems no question that when the carnations are placed in the houses they will continue more healthy in a soil somewhat lighter than that which is here recommended for summer growth. A soil that is friable and through which the water passes readily, an admixture of a sandy soil with heavy loam answers the purpose. The best carnations noticed last winter were grown in such a soil.

Burned sods, if from heavy soil, will prove to be very desirable. These, when thoroughly burned, can be incorporated with soil not so treated in equal proportions, and will be found extremely beneficial, not only in keeping the soil sweet, but in imparting a vigor of growth and a richness of color that no other ingredient ever gives.

Sods to be treated in this way should be dug in late summer and stood on end, if wet, to dry, for the drier they are the better they will burn. A stack of wood piled evenly until it attains the dimensions of three or four cubic feet, should next be prepared. Sods may then be

stacked up the sides and over the top of this wood, the ends of the pile being left open in order that when the wood is lighted the fire may get a good chance to burn. When this is well under way close up both ends with sods and heap as many more on the top as the desire is to have burned. The heap should be left untouched for two or three weeks, during the whole of which period the sods will continue to burn.

Any one once trying soil prepared in this way will be pleased with the result from its use. For it is not only desirable for carnations and roses, but for all pot plants.

ALFRED E. WHITTLE.

Seasonable Notes.

CUTTINGS.

The culture of the carnation having become so extensive, and its use now entering so largely into our floral calculations and arrangements, it is of the utmost importance that we avail ourselves of every point likely to assist us in the attainment of success. With this end in view growers whose stock is now comfortably housed and flowering in a satisfactory manner, and who realize the necessity of being to the fore, will by the time these remarks reach the readers of the *FLORIST* be keenly on the alert for cuttings for next year's crop.

My experience is that if carnations are required for summer flowering, in order to secure the best results, the cuttings should be put in the sand in the month of October, and the earlier in the month this matter is attended to the better; if good stout cuttings are secured and placed in a cool airy situation during the first half of the month they will be well rooted and ready to transfer to small pots in December.

In a month the small pots will be filled with roots, at which time my practice is to draw the center out of each plant and transfer to 3½-inch pots; at the same time the young plants begin to make new roots in the larger pots, they also develop a circle of young shoots around the base of each, and if the temperature is kept low, say not over 50°, they will be sturdy plants ready to move out to a cold frame in March, and planted where they are intended to flower as soon as the weather will permit in April.

From my experience of the past two seasons I feel prepared to say that if some good free flowering white variety of carnation is used for the purpose, and treated as above recommended (varied of course to suit locations north or south of this), that it will pay largely, and will be found such an immense improvement over the white asters that those who try the experiment will be surprised that they had not done so before.

If early flowering is the object, and if the plants have five or six shoots no further stopping will be necessary, but if rotation or succession is required they can be stopped in batches to suit, remembering that if the plants are strong and the centers of the shoots drawn out in May, everything being favorable they will be pretty certain to flower in July. I may further add that if carnations intended for summer flowering are planted where a supply of water is at command the prospects of success will be considerably increased.

For the main crop of carnations December is the time to put in the cuttings, of course I am ready to admit that good plants may be grown from January, February, or even March struck cuttings,

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

CARNATION CUTTINGS

but the chances of success recede with and in proportion to the season; I therefore advise that if substantial success is looked for, secure good stout cuttings in December. Go way down near the base of the plant for them, do not be satisfied with weak spindly or flowering shoots, if you do disaster and disappointment will surely follow. Another great advantage resulting from December cuttings is the fact that there is abundant time for them to make good roots in a low temperature, which in my opinion is one of the most important features of success in carnation culture, for while we thoroughly understand that carnations may be forced with impunity, especially the white varieties, it must be remembered that every degree we add to the temperature over 50° or 55° is at the expense of the plant, and cuttings taken from plants before will be very far superior to cuttings taken after the plants have been subjected to the high temperature, and as the forcing is most likely to occur just before the holidays, by previously securing the cuttings we do so before the plants are enfeebled by excessive heat, and secure all the advantages to be gained thereby.

By pencil sketches I have endeavored to show what in my opinion constitutes the different grades of quality in carnation cuttings.

Fig. No. 1 represents a cutting of the very best description, the outside foliage may be shortened a little without injury to the cutting, and the process would allow the cuttings to be placed closer together in the sand, and the center may be drawn out of such a cutting either before or just after it is rooted, the beauty of such cuttings is they are sure to root and when rooted you have a plant of the best kind at once.

Fig. No. 2 represents a cutting such as we are sometimes obliged to be content with, because carnations do not all grow alike, Grace Wilder, for instance, rarely gives such cuttings as No. 1, in which case we do the best we can and take the best we can get, the redeeming features of the finer growing sorts, however, is their tendency to be firm, compact and well developed, resulting generally in

good plants in less time than is required for the strong growers.

Figs. No. 3 and 4 although not fit for cuttings, are often used as such, their use, however, should be held in universal condemnation, because no matter how good roots they acquire in the sand, as plants they are utterly worthless, and the selling of such as rooted cuttings is simply an outrage.

Last spring I received quite a number of plants of the new variety Tidal Wave, also some plants of the new white variety L. L. Lamborn, and I think nearly every plant of the two lots must have been struck from cuttings such as I describe in No. 1. Nothing could be more satisfactory (I am in hopes of being able to write about these and other sorts later in the season), but I received a thousand rooted cuttings of another sort near the same time, which seem to have been grown from such cuttings as shown in Figs. Nos. 3 and 4; there may have been a few among them as good as No. 2, but they were exceedingly scarce. As soon as received, this lot was potted into thumb pots, and almost directly they began to throw up flower buds, and the buds being continually cut off induced them to throw up many more with once in a while a miserable little shoot; many of them died before planting out time, and many more died through the summer; at lifting time although they presented an appearance perfectly miserable I still lifted some of what was left, and the present appearance of those is dejected and woebegone in the extreme. I wonder if any brother florist had a like experience during the past year?

H. E. CHITTY.

Paterson, N. J., Oct. 21.

Caterpillars and Greenfly.

Mr. May, in his instructive article upon the growing and forcing of mignonette, which appeared in the *FLORIST* of September 15, speaks of the depredations of caterpillars, and mentions as a preventive, the placing of mosquito netting over the ventilators of the house in which the mignonette is growing.

No doubt this is a radical preventive,

but even if it should not be done, we are not left to the expensive labor of picking by hand the caterpillars from the mignonette seedlings.

Formerly it was my custom to carefully look over, every morning, the mignonette for caterpillars, and remove them by hand, as the preventive by the netting had not been brought to our notice. But as Mr. May says, it was slow work; not only expensive, but never very thorough, and therefore necessity compelled experiment.

Having some of Hammond's "Slug Shot" on hand, the thought occurred that it might prove efficacious in keeping the caterpillars away if dusted on the plants. This was done, and proved to be successful—so successful that it has been used ever since. Two or three dustings are all that are required to keep the plants from injury. The "Slug Shot" does not injure the mignonette, but, on the contrary, appears to quicken growth.

White hellebore is another remedy that can be used with similar success, not only for the mignonette but also to destroy the caterpillars that sometimes are so troublesome upon Jacqueminot and other hybrid roses which are planted inside the greenhouse.

It is claimed for the "Slug Shot" that it will destroy aphids, but experiment with it for this end, did not produce the desired result.

Probably every florist, at times, finds that the remedies proposed for the destruction of greenfly, other than burning tobacco stems, prove inefficacious. Especially is this so when precautionary measures have been neglected, and greenfly has got a strong foothold.

It is true that this pest should never be neglected—an "ounce of prevention is always better than a pound of cure." But we are all human, and the best of us sometimes get caught napping. When this is so, throwing stems down in the paths, or evaporation of water in which tobacco stems have been placed, will prove of no avail, and recourse will have to be had once more to the old practice of smoking. Generally with the result that all the life is taken out of the flowers

of our high-colored roses for some time afterwards.

Yet there is a way in which houses may be smoked with tobacco, and little if any harm be done to the flowers which have to be cut from the roses growing in them. This way is simply to smoke lightly and smoke often. When it is necessary to smoke a house of roses, let the first smoking be as light as possible. Continue the process for two more nights, and on the last night let the fumigation be somewhat heavier. By this method the fly will be killed and the roses receive comparatively little damage.

A. E. WHITTE.

Very Early Chrysanthemums.

I am again disappointed in those varieties which flower in August and very early in September. It does seem as though they will not ever be satisfactory—I mean those varieties we now have to work with. The question is do we want chrysanthemums before the 15th of September? It seems to me that before the middle of September they are not wanted or have but little appreciation. I can remember when a boy that the old Scarlet Gem was used as a bedding plant among other things in connection with Ageratum Mexicanum and yellow calceolarias and the old blue lobelia.

The only varieties that have been at all satisfactory are Golden Fleece and Pierre Verfelt, both pompons, the first a bright yellow and the latter bronzy yellow and brown; these were passable the first week in September. Of the varieties which were in flower the first half of October and were acceptable, appreciated and beautiful, are the yellow and white Desgranges and M. E. Nichols, a lovely shade of pink with medium sized flowers of nearly the same tint as the La France rose—unfortunately many of the flowers come one-sided, but if the thinning is not began too soon there is still enough perfect flowers left. It is a healthy, strong and free flowering variety. This variety is known also as "October Beauty" but the right name is M. E. Nichols, and it should be corrected.

Another very pleasing kind introduced two years since is Eleanor Bares, with tawny buff and pink flowers of good size, very free and very healthy. I must also say a good word for Spaulding's Harvest Queen, a good sized white flower of fine habit and robust health. Lambeth is also a good white but rather uncertain in growth. Delaux's Triandartu promises well, as does Blanche Precoce. Of older kinds, Fleur Parfait, Alex Dufous, Petit Frise, Jas. Salter and its white sport Lady Selbourne. Mlle. Lacroix is beautiful, and now we have a pink sport from this very beautiful variety.

La Vierge and La Neige are both failures with me this year as is also that very beautiful white pompon La Desree. Other varieties which were in flower the third week in October were the old Jardin des Plantes or Mme. Damage, a white pompon; Chevallier Damage, a grand yellow, and the very old yellow Annie Salter; Gloriosum and Triomphante, be-

sides some newer kinds which I am growing for the first time.

Exhibition plants and flowers will require more attention each day. Beware of mildew and kill at once with sulphur in some form. All very dark reds, browns and crimsonous as soon as the first rows of petals are unfolded should be shaded from the bright sun to obtain their true colors. A way to shade will suggest itself to those who are determined to win.

In packing plants for exhibition to carry long distances remember always to pack as close together as possible. It is best to pass around each plant a string so as to draw the heads close together to prevent whipping which always occurs where flowers are loose; the fact of their being snugged up prevents oscillation.

When the plants are unloaded and before staging it is an easy matter to cut the string and press out the stakes to their original positions.

JOHN THORPE.

Cut Flowers for Exhibition.

The shipping of cut flowers to exhibition points is always attended with anxiety and to arrive in perfect condition requires great care. Those having boxes made expressly for the purpose do not require to be prompted, but the amateur or those who are beginners and have not complete outfits will do well to take the following hints:

All flowers should be cut and placed in water at least twenty-four hours before shipping. Flowers that are opening too quickly should be cut, if even a week before the time, with long stems, placed in a cool dark shed or cellar where the atmosphere is dry. A piece of the stem should be cut off about every third day and the water changed.

In packing wrap each flower carefully in tissue paper just tight enough not to bruise. They should then be placed in either boxes or baskets in tiers so that they do not press on each other. In boxes strips should be nailed far enough apart so as to allow the flowers not to chafe, the stems to be held in place with other strips, using damp paper as a packing between each layer of stems. The same method to be carried out in basket packing, except that strong string is to be used instead of wood strips. Do not allow the petals to become wet during packing.

In staging the flowers all those with long and drooping petals will require to be gently shaken before placing in position, remembering always to make a new surface at the end of each stem by cutting a piece off before placing in water on staging.

Labelling should be legibly and neatly done, placing the names conveniently in front of each flower.

As to the arrangement of the flowers the larger flowers should be at the back, the smaller ones to form the front rows.

J. T.

The National Society.

Unfortunately the society is not in a position to assume any control over exhibitions this year. But it will be in order to suggest a few points as to the certifying of and the recognition that should be given to seedlings or new varieties from sports. The requisites should be: First, distinctness from existing varieties; second, suitability for either exhibition blooms, specimen plants, pot culture for market, or cut flowers for sale; third, new types and new colors; fourth, though not

last, vigorous habits and healthy growth. No certificates should be awarded unless four flowers are shown; a part of the plant showing at least ten inches of stem with leaves should accompany each variety, or what is better a plant or plants in not less than 6-inch pots would be more satisfactory.

It should be borne in mind that certificates can and should be awarded to plants and flowers for the purposes they are best adapted to. It is well known that many of our very best exhibition varieties shown as cut flowers are fit only for that purpose; for instance, Mme. C. Audiguier grows to the height of seven feet, and the flowers of Soliel Levant droop so on the plant as to positively hang their heads, yet they are invaluable on the exhibition stand; Gorgeous is a magnificent pot plant, but the flowers are of no use on the exhibition table.

One thing which has been and must be admitted is this: Those who have been interested in the dissemination of the chrysanthemum have let their discretion interfere with their judgment. In other words, they feared the child would die from lack of inanition.

But that time has gone by and there is no further any reason for anxiety. We can now stand and ask for the best only, so that from this time there need be no fear that what is done in the way of encouraging new varieties will not be done rightly and well.

JOHN THORPE.

EARLY OCTOBER FLOWERING CHRYSANTHEMUMS.—There are 25 varieties of chrysanthemums flowering October 1st to 15th, grown in Chicago, of which the following are the best, arranged in the order of their merit. In making this list I have considered what I see and hear in visiting florists in addition to my own growing. Mary Edd, small white; Blanc Precoce, white; Gorgeous, yellow; Mons. E. Nichols, Mons. Neville; Lyon (pompon). The following new comers are very promising, and blooming October 1 to 5: Malbran, M. C. Souchet, Leveque and Capucine. There is ten days or more variation in time of flowering with different florists, generally pot grown plants blooming earliest.

Chicago.

JOHN LANE.

New Gladioli.

Something like a "sensation" was experienced lately when Messrs. Veitch exhibited, on behalf of M. Lemoine, some new hybrid gladioli, raised, we believe, by M. Max Leichtlin in the first instance, between G. Saundersi and G. gandavensis. G. Saundersi is comparatively hardy and has scarlet flowers, spotted with white on the lower segments. President Carnot, one of the new race, has very broad open flowers, the perianth segments spreading, bright crimson flaked on rose, the two lower ones of the inner series have a yellowish-white blotch at the base, mottled and streaked with crimson. From the brilliant coloration, the flat form of the flowers, the remarkable vigor and hardness of the strain, there is no doubt these gladioli will satisfy the public taste and introduce a new element of beauty into our gardens. President Carnot is shown in the center of the group in the illustration, the flowers from which the drawing was made measuring five inches across. On the left hand side is the variety Andre Chenier, of Lemoine's hybrid spotted strain; the colors are cream flushed with pink, with the two lower inner segments purple, with golden-yellow apices, which

NEW TYPES OF HYBRID GLADIOLI.

render it very conspicuous. The third variety shown is Alsace, of the same section as the last, the colors being pale buff and purple; both these flowers are much cupped. The superiority of the new Nanceianus type is evident.—*Gardener's Chronicle*.

Long Island Notes.

BY WM. FALCONER.

THE WHITE COSMOS BIPINNATUS is a lovely flower. We have it in quantity out of doors, also in pots in the greenhouse, and the indoor flowers are larger, finer and more regularly perfect than are those on the outside plants.

THE YELLOW IPOMÆA made a very good growth of foliage all summer, but the vines only attained a height of some four or five feet. And it didn't blossom, in fact, I am inclined to think it is shy-blooming in cultivation anyway, and especially so when planted outside.

SEDUM SIBERDII both green and variegated-leaved are very neat and pretty hardy plants not uncommon in cultivation as bracket or basket plants, but they are perfectly hardy and live along year after year. They are now (October 17) in full bloom in the open border where their pink-purple flowers are a cheerful addition to our supply of blossoms at this season of the year. If you look in your Dictionary of Gardening you will find that this species blooms in August, and that *S. spectabile* blooms in September. But the truth of the matter is *S. spectabile* blooms in August-September, and *S. Siberdii* in September-October.

OF ECHINOCACTUS CANDICANS an immense consignment of beautiful plants in fine condition has been received by an eastern florist.

SOLANUM JASMINOIDES has grown more and flowered less this season than usual on account of the extra wet summer. On a trellis in sandy land and a warm sunny place it blossomed abundantly with me.

DWARF CANNAS.—I have just cut over ours, lifted, divided and planted them very close together in a warm frame to keep them there over winter. On the 23d of May last we had a consignment from England; the plants were one-eye stock in pots. After hardening them off I planted them out in good ground, and now have lifted and divided them. Two plants of Louis Thibaut broke up into 10 and 17 pieces respectively, and the other kinds varied between 5 and 15 divisions, and these divisions are good well rooted parts. This shows how easily and rapidly they can be multiplied. Adrian Robine has fine crimson foliage, but grows too tall and its flowers aren't good enough to save him from the rubbish pile.

MUSA ENSETTE.—If you get a hundred or more seeds now and sow them in a warm greenhouse, you can get up a stock of splendid plants for spring sales. Advise your customers to plant them out in an open and sunny but warm and sheltered place, and in rich, deep, porous soil and give them abundance of manure and water. The plants grow immensely and give me a great deal of satisfaction. And they grow so fast that I have resolved to stop keeping over old plants, and just get up a fresh batch from seed every year. This saves work and room.

CHRYSANTHEMUMS are grown in large quantity by Long Island florists, and, in many cases, in provisional houses. These houses are temporary affairs made up of the unoccupied sashes from the "jack"

houses or frames. Where convenient the plants have been grown along all summer planted out in their blooming beds, and in these cases finer flowers, stiffer necks and better foliage are the rule, only the plants get pretty tall some times. By the time the sashes will be needed for the roses the chrysanthemum season will be past. And where chrysanthemums are planted on benches in low roofed permanent houses I see an immense number of violets in pots in cold frames being grown to succeed them.

AS REGARDS VIOLETS our florists are very particular to pick off every leaf just as soon as they notice the least speck of disease-spot on it, and they tell me this is the only way in which they can hope to secure a good crop of flowers. Of course where the disease is very severe violet growing is abandoned altogether for a few years.

ON ACCOUNT of the disease I have given up growing violets for a couple of years. But I grow a lot of hardy garden kinds, and I find that *V. cucullata* becomes diseased, often quite bad, and right scattered among it *V. Patini* seems absolutely disease-proof, but then it is of no use for cut flowers. And the disease doesn't seem to affect *V. canadensis*, *V. pubescens* or other branchy sorts, or *V. pedata*. The Czar, although it suffers less than Marie Louise, also gets badly "scorched."

DWARF DAHLIAS UNDER COVER.—At a florist's I visited the other day I found quite a greenhouse filled with white dahlia in bloom. The dahlia (no name) flowers were smallish, pure white, very double and abundant, and under the glass they seemed to open bright, clean and perfect. The plants were two to three feet high, bushy and free, and they had been put out in the open ground in a bed and somewhat close about midsummer. And it was over this bed that a temporary greenhouse structure had been set up; it was made of unoccupied sashes as one would a chrysanthemum house. This plan of having a houseful of white dahlia in bloom for a few weeks preceding the chrysanthemums impressed me as being something worth imitating.

RHUS COTINOIDES is the American prototype of the Venetian sumach, and so rare that I began to regard our specimen as unique in cultivation. But now a southern nurseryman comes forward with over a thousand young trees for sale.

BUDDING DOGWOODS.—Andrew S. Fuller writes: "I find that the dogwoods take as readily by budding as the apple or pear."

A VIOLENT wind and rain storm early in September stripped many of our trees and shrubs and prostrated things generally. Now several spiræas that were in the teeth of the storm have started into fresh growth and scattering bloom. This is bad for the plants.

THE PERENNIAL GAILLARDIAS—the "hybrid" and *grandiflora* section—are still yielding a few good handsome flowers.

MAXIMILIAN'S SUNFLOWER is the latest sunflower that we have in bloom. It is a perennial, quite hardy here and in best bloom during the first three weeks of October. The flowers are medium sized, bright yellow, very showy and closely set along the stems near the end. It likes rich ground, shelter from rough wind and to be lifted and replanted every year, or at least every second year. Although it does fairly well in the same spot year after year it is only when re-

planted every year that its greatest glory is exposed.

THE LOBLOLLY BAY (*Gordonia Lasianthus*) and *Franklinia* (*G. pubescens*) give me a good deal of satisfaction in summer and fall on account of their large white blossoms which somewhat resemble those of single camellias. They are a trifle tender as far north as this, but with a little care they pull through nicely. Further south they are lovely. I can not imagine anything prettier than neat stocky gordonias in bloom in 6-inch pots, and they blossom freely when only quite small plants.

IF IPOMÆA RUBRO-CERULEA would only bloom more freely what a magnificent morning glory it would be, but it is too shy for anything.

LONICERA HECKROTHI is a new and everblooming vine honeysuckle that I came upon at Hoopes Bros. & Thomas' last fall. It was an accidental discovery in a West Chester garden and its origin is unknown, but it is probably a self-sown seedling from the trumpet honeysuckle and the result of a cross with some other garden sort. It is a thrifty vine of the semperflorens habit and a most copious bloomer, and it keeps in bloom all summer long. The flowers are in terminal bunches, deep dull red and yellowish. Just when I was at the nursery there they had an order from a Boston landscape gardener for every plant they could spare of this honeysuckle, but I secured a couple. And I have been extremely well pleased with it. In early summer the flowers were ruined by aphides in the same way as American and European sorts are, but after midsummer they came as clean and free from insects as Hall's or any other Japanese honeysuckle, and in beautiful profusion.

SALVIA PITCHERI is the finest blue flower we now have in bloom. It is not quite hardy here. Easily gotten up from fresh seed.

THE GLORIOUS "SUNSET PLANT" is too glorious at 50c a plant when it can be gotten up so easily from seed, and seed is retailed in New York for 5c a packet. I have grown some of the western sphaeralceas for a dozen years and now have scores of plants of this glorious novelty. They are very hardy and long-lived and last in bloom most all summer, but there is nothing striking about the plant or its blossoms; the flowers are small and of a very poor color. Among cut flowers of no value whatever, and precious little among border plants.

THE YELLOW AMARYLLIS (*Sternbergia lutea*).—One of the prettiest things I saw at Queens the other day was several hundred of these in full bloom. They were planted in a cold frame. They are not large plants like an *Amaryllis Johnsonii* or *A. alula*, but small plants more in the style of a zephyranthes; and their flowers are of the purest yellow and in size like an overgrown crocus. But they are seldom seen here in cultivation and for this reason: We don't usually get our bulbs till September or October, and at this time these yellow amaryllis bulbs are soft and shriveled and sprouting. September and October are their blooming season, they are then in full vigor; the proper time to plant them is July. They are hardy in warm sheltered places, but require a long open fall to give them a good period of growth, hence it is that they are more amenable to cold frame than open garden cultivation.

WILD ASTERS.—My old companion-inspades F. W. Burbidge (the recently

anointed M. A. of Trinity College, Dublin), writing to me the other day says: "But best of all hardy plants now in bloom are the dear old Michaelmas Daisies of our childhood's days, the star flowers of your land. They are in masses among rhododendrons and other shrubs, and are most lovely, free and natural, harmonizing in color with the grey Scotch firs and the blue haze of the distant downs. As cut flowers or for massing and grouping near old country houses these asters are perfect and the best of them will have a great future here, so make a good selection in time." Yes, but we don't call them "star flowers," we simply call them wild asters or daisies. Starwort, one of Dr. Asa Gray's names, must be recognized, still the people don't use it. We call the little *Trientalis* of our woods the "star flower." Of course the word aster itself warrants the use of the name star flower, still the people do not adopt it.

MOONFLOWERS AGAIN.—The common moonflower plants sold by florists and *Ipomoea bona-nox* grown from seed (dark colored), and side by side are indistinguishable. The plants from cuttings come earlier into bloom than do those from seed, but after both are in full growth I can not tell them apart. Both strike freely from cuttings and neither has, this summer, shown any inclination to produce seed. On the other hand *Ipomoea grandiflora alba* (as *grandiflora* itself is white, what's the sense of adding on the alba?) from the New York seed houses, I. Childs from Childs, and the white seeded moonflower raised from seed gathered for me in the wilds of Southern Florida, are all one and the same thing, at least as growing here side by side they show no difference. All three display a more luxuriant growth than *I. bona-nox*, and their blossoms are a fourth larger and they have larger foliage. And they bear seed abundantly, but I fear the seeds will not ripen well in the north, at least this is my experience. It is curious that although there is no doubt whatever of the fact that this white seeded form is indigenous to Florida, it is not mentioned by Chapman, Gray, or any other of the leading American botanists, so far as I have seen, and there is no record of it in the Harvard Herbarium.

Steam Versus Hot Water for Heating.

BY JOHN BURTON.

[Read before the Florists' Club of Philadelphia, October 1, 1889.]

What are the advantages of steam over hot water; or hot water under pressure for greenhouse heating?

When accepting the appointment to read a paper on this subject I had no idea that I could tell you anything new, but might possibly retell some of the things already known to those having steam in practical use, and things that must have been read of by all interested in greenhouse heating. For some time after using steam I was doubtful if it was any better than hot water, but this feeling I think was caused by my expecting too much. The steam men had painted in such glowing colors the advantages of their system, the allround saving of labor and fuel, the low first cost, etc., that when I found the cost of putting in about the same and the saving of coal doubtful I was disappointed, and am reported to have said "I would toss up a penny to decide which to use, hot water or steam." But now I think I could decide without the assistance of the penny.

In my opinion the advantages of steam

are: First, and probably the most important, the ease and quickness with which you can put it on or take it off. This I put first because we all know that plants require a certain temperature, or to put it more plainly we know the importance of maintaining an equal heat in a house; to do this with hot water requires great judgment and in some instances is impossible. You must commence in the afternoon and make up your mind an hour or two ahead what heat will be required, and if the sun is shining, with the prospects of a cold night, you will either have it decidedly too hot while the sun is on the house, or as much too cold directly the sun goes down, and the latter I think happens pretty regularly in the kind of weather I have mentioned above. But probably the worst effects of this is felt in the morning when the sun comes out after a cold night; the house is covered with ice causing you to fire freely until it is melted by the sun heat, when you at once get the heat from that source into the house, which with the pipes still very hot, makes the temperature rise very rapidly; you can not cool off the pipes, so of necessity put on more ventilation than is desirable so early in the day.

With steam these difficulties may be avoided to a great extent. In the afternoon you can store up the steam to a pressure high enough to fill at a few moments notice all the pipes required; if you make too much it escapes through the safety valve. In the morning you can have it on until the last moment, then by turning it off cool the pipes in a very short time, of course letting your extra steam escape; this may seem a waste, but is not so much waste as to keep it in the house to the injury of your plants. I may seem to make more of this than it deserves, but I believe I have not overdrawn it.

Another advantage is, you can carry it long distances and so can do with one fire what with hot water would take several, thus making a saving of labor and coal, for where there are a number of fires there must be a certain waste of fuel in the starting and keeping going of each fire whether large or small, when heat is not wanted in the houses. The centralizing of labor to one hole, only having one place to take coal to, one place to take ashes from and one fire to attend to must be a saving in labor, as compared with having several places.

Again the pipes are so much smaller they are more easily arranged in the houses without being in the way. Often there are enough 4 inch pipes under a table to occupy the whole space, were they not there this space could sometimes be used to advantage for something else, and where there are no tables the ground is often very valuable. Should any one be desirous of using overhead heat in his houses he is sure to find it easier and much less weight for the house to carry, to use 1 or 1½-inch steam pipe than 4 inch hot water pipe; and should you want to add to the number of pipes during cold weather it can be more readily done than with large pipe.

I believe that with the best kind of boiler there is also a saving of coal, and especially so where they are fixed to burn pea coal, which can be done wherever you have a good draught and plenty of boiler capacity.

Another advantage is the use you can make of steam to destroy mildew. Often in the fall by heating one pipe and putting sulphur on you can check this pest, when to do it with hot water would necessitate making all the pipes hot,

running the temperature of the house to an injurious point and then not as effective as one steam pipe. An occasional sprinkling over steam pipes with tobacco water will be found a check to the increase of greenfly.

In putting in steam there are a few simple rules that must be followed to have it work well. First have your boiler low enough to well drain the pipes back, then let pipes be so arranged as to be highest as soon as possible after entering the house, with a slight grade all round and back down to boiler, having water level in boiler at least two feet lower than floor of house. If this is done you should have no trouble with the circulation. At some places where there is difficulty in getting the boiler low enough they have a trap to lift the water up again to the required level, and I believe this answers very well, but of this I have no personal knowledge. Don't fail to put in plenty of valves, in fact I think there should be one in every pipe, so you may turn on only one pipe at a time. In a great many places this is not done; to save the expense of the valves it is so arranged as to turn on a whole coil of pipes (say 4 or 5) at once, thinking that being a good big house you will not want so little change as one pipe, but this is a mistake for the time will surely come when one pipe more would be just enough and two would be too much.

It has been said that the extreme heat from steam pipes was injurious to plants, but this I believe is a mistake unless they come in actual contact and then whether steam or hot water they would be damaged. Another objection often mentioned is having your whole place depend on one boiler. Would not the result be had should anything about it give out? I do not think there is any mere likelihood of a steam boiler giving out than one for hot water, but to provide against accident would arrange them in pairs and so connected by valves as to be able to cut off either boiler entirely and let the other do the work until repairs are made. This I think can be done with less expense where there are only two boilers to be connected than where there are three or four pairs to connect, as would be the case with hot water, and each connection adds to the expense in valves, etc.

With hot water under pressure I have had so little experience that I can not say much about it, but as compared with steam I think it has no advantages on a large place. On a small scale it can be made to work very well. I have one house standing alone where I use it, and the foreman says it is the best heated and most easily managed house on the place. Whether hot water under pressure would do with large boilers to run a number of houses I am doubtful, and to put a boiler in for each house would be no benefit over the old system of hot water.

OBITUARY.

JAMES EADIE a well-known florist of Cleveland, O., died at his home in that city October 9, at the age of 62 years.

He was a native of Scotland, and came to this country in 1856. He located in Philadelphia and was for thirteen years gardener to Madam Rush, afterwards starting the place now known as Hugh Graham's at Nineteenth and Thompson streets. He then removed to Cleveland and started a commercial place at Glenview which he has conducted for the last twenty-three years. He leaves a widow, two sons and four daughters, who will carry on the business he founded.

THE AMERICAN FLORIST

Subscription \$1.00 a year. To Europe, \$1.50.

Advertisements, 10 Cents a Line, Agate;
1 inch, \$1.40; Column, \$14.00.
Cash with Order.

No Special Position Guaranteed.

Discounts, 3 months, 5 per cent; 6 months, 10 per cent; 12 months, 20 per cent.

No reduction made for large space.

The Advertising Department of the AMERICAN FLORIST is for Florists, Seedsmen, and dealers in wares pertaining to those lines ONLY. Please to remember it.

Orders for less than one-half inch space not accepted.
Advertisements for November 15 issue must reach US by noon, Nov. 9. Address

THE AMERICAN FLORIST CO., Chicago.

A COPY of the proceedings of the Buffalo convention of the Society of American Florists has been received from Secretary Stewart. As the last convention was one of the most interesting and valuable ones ever held by the national society it naturally follows that the stenographic report occupies a position on the same plane. The many valuable essays together with the very interesting and instructive discussions on the same are to be found complete in its pages. The typographical work is most excellent and Secretary Stewart is to be congratulated upon his systematic compilation and careful reading of final proofs. How any florist can get along without this report is a mystery, but we understand that there are still some florists who have not yet joined the society and others who have allowed their membership to lapse. This should not be. Such should wake up from their nap. Don't let a paltry \$3 stand between you and such a valuable book as this. It is worth ten times that to any florist who has got brains enough to make practical use of good, solid information. And you certainly have, hence you should send in your membership fee to Secretary Stewart which will entitle you to a copy of the report.

IN ANOTHER COLUMN appears a report of an investigation of the fungous disease known as "black spot," by the professor of vegetable physiology of the Hatch Experiment Station at Amherst, Mass. prefaced by some very interesting information regarding fungi in general, which will undoubtedly be of great interest to every grower of plants. If a solution of sulphate of copper will successfully prevent the spread of the disease and secure immunity for plants not affected, it will certainly be our own fault if our plants are not free from this disease. To immediately remove and destroy the diseased parts of affected plants has been recognized as the first move to make in combating the disease, and its great importance is most forcibly impressed upon our minds by the facts brought to our notice in the report mentioned. If the solution recommended will accomplish the results stated, then to have "black spot" on your roses will be as much of a disgrace as the presence of greenfly now is. We trust that rose growers generally will try the preventive suggested and report the result to us.

WE ARE PLEASED to see that the officers of the Hatch Experiment Station of the Mass. Agricultural College, Amherst, Mass. are expending some of their time and energy in solving some of the problems with which greenhouse plantmen are confronted, as shown by the report on the "black spot" disease in another column. The report of a trial of steam and hot water boilers under nearly similar conditions which appeared in their April bulletin, and of which we published

extracts, has it appears provoked many inquiries and some criticisms, and in the October bulletin appears a request to those who have houses alike in all respects to heat them by the two different mediums, keeping careful records of temperatures and amount of coal used in each, and thus join with the station in tests that will be conclusive.

NEW TRADE DIRECTORY.—Work upon the new directory is now progressing rapidly. If you know of any business changes in your vicinity do not fail to report them to us. And if you have not yet reported the number of feet of glass on your place send in the figures at once that same may be given in the directory. We will receive advertisements for the directory up to December 1, but give us your orders as early as possible. We have already begun setting up advertisements for the book and the earlier copy is in the more time we can devote to getting the ads up in a tasteful manner. Advertising rates sent on application.

MESSRS. PITCHER & MANDA, Short Hills, N. J., will make a special show of chrysanthemums and orchids at their establishment November 4 to 9 which will undoubtedly be visited by all who can make it possible to be present. Mrs. Alpheus Hardy will of course be there in great force and it is expected that a few "babies" will make their debut. We are informed that the orchids will be in splendid bloom at the time and will include a fine piece of Vanda Sanderiana, hundreds of cypripediums, etc. For the convenience of visitors they publish a time table in their advertisement in this issue.

A SAMPLE of a new tree and plant label has been sent us by Messrs. Johnson & Stokes, Philadelphia. It is of very thin copper cut with two free ends to use in tying. It is so thin that by writing on it with only slight pressure a name can be impressed on it and the same can not be eradicated except by hammering. As copper is very durable and the price placed upon the labels is reasonable we believe they will be very useful, especially on plants in the open field in summer.

READERS of the FLORIST who desire to give the paper their fullest support may assist materially by confining their orders as far as possible to those who advertise in its pages.

PUT YOUR SIGN in the new trade directory. Copy will be received up to December 1, but send order earlier if possible.

Catalogues Received.

Geo. W. Miller, Chicago, plants; John Laing & Sons, Forest Hill, London, England, bulbs and plants; Boskoop Nursery Association, Boskoop, Holland, nursery stock; L. C. Lischy, Nashville, Tenn., nursery stock; A. F. Leonard & Co., Springfield, Mass., seeds and plants; Saml C. Moon, Morrisville, Pa, nursery stock; H. S. Anderson, Union Springs, N. Simmers, Toronto, Ont., bulbs and seeds; Association Flora, Boskoop, Holland, nursery stock; D. B. Woodruff, Macon, Ga. plants and bulbs; M. M. Bayersdorfer & Co., Philadelphia, florists' supplies.

Boston.

The cut flower trade shows a decided improvement within the past two weeks.

Heavy frosts have finished up all the remnants of outdoor bloom, and the cool weather has given an opportunity for firing up in the houses, so that the roses now coming into market are of good quality. Prices have stiffened up considerably, and will continue so unless the chrysanthemums, which are now beginning to appear in quantity, should affect the market for other flowers unfavorably. This has been the case in former years, but to a lesser extent last year, and there are some who predict that this year the effect will be still less. True it is that the class of chrysanthemums grown and called for now do not yield as much bloom nor are they as easily managed as the old fashioned small flowered kinds which were grown almost exclusively until within a few years. The prices asked and often readily paid for chrysanthemum blooms of the finest quality nowadays compare favorably with the prices of the highest class roses, and it can scarcely be said that the chrysanthemum any longer cheapens trade. Fifty cents a bloom at retail is far from cheap.

Violets are fairly abundant and there is every prospect that they will be as popular this year as last.

Long stemmed carnations are not very plenty as yet. Short stemmed ones are even scarcer. Everybody who grows carnations is striving to produce long stems, and the result is that the party who wants a lot of short stemmed white carnations for funeral designs nowadays finds it difficult to get his wants supplied except by paying the price of long ones and then snapping the stems off, all of which is done with a very dry face.

Among the new or rather unusual flowers seen at present is the beautiful cosmos. The windows of the florist stores fairly sparkle with clusters of them.

The Gardeners' and Florists' Club will discuss the chrysanthemum at the November meeting, when many of the local experts are expected to give their experience and their views. The interest in this subject ensures a good attendance, but there is every prospect of lively and interesting meetings for this season, as the impetus given by the approaching convention here is beginning to be felt.

Benj. Grey is still cutting a few blue pond lilies. He grows them for winter bloom in pans. For summer blooming he has a tank 90 feet long and cuts them in large quantities from April to September. He pronounces the N. Zanzibarensis and the native rosea the two best varieties for general culture.

He has a house of Pandanus Veitchii now which is well worthy of a visit. The plants are unusually well colored. A fine bench of eucharis gives promise of a bountiful crop.

The Bay State Fair which has just been held in Mechanics Building was a pronounced success, nearly 100,000 persons having visited it during the six days it continued. Of course the splendid cattle and horses and the concerts attracted the great body of visitors, but it was noticeable that the fruit and plants occupied the most desirable location in the center of the large hall, and the liberal premiums offered in this department indicated the prominence attached by the managers to these exhibits. The display of palms and decorative plants was good. It comprised in the main the same collections which had been shown at the horticultural exhibition a fortnight previous.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. McCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1899.

MR. ALFRED HENDERSON'S illness continues and is reported to be very serious.

SEND US an advertisement for the new trade directory. It will be frequently consulted by buyers.

THE MINNEAPOLIS *Star* illustrates a two column article with views of the N. B. G. Co.'s trial ground and seed farm.

PHILADELPHIA.—S. L. Allen & Co. have completed their new factory and have removed their office to 1107 Market street.

THE SEVENTH ANNUAL REPORT of the American Seed Trade Association has just been issued by Secretary Albert McCullough.

THE OCTOBER 19 ISSUE of the *Rural New Yorker* devotes three or four pages to the Dwarf Lima Beans as offered by three prominent seedsmen.

DOVLESTOWN, PA., Oct. 17.—The summer residence of W. Atlee Burpee, of Philadelphia, on the Burpee seed farm, a mile west of the town, was burned to the ground this evening. It was erected last spring at a cost of about \$2,000. The flames originated in the kitchen, but how is not known. Neighbors succeeded in saving all the valuable furniture. Mr. Burpee and family vacated the cottage only yesterday to return to the city.—*Philadelphia Enquirer*.

News Notes.

CAMDEN, N. J.—A chrysanthemum show will be given at Read's Hall beginning November 6.

LEBANON, MO.—The Missouri State Horticultural Society will hold its 32nd annual meeting here December 3 to 5.

OSHKOSH, WIS.—The Winnebago County Hort. Society will hold its annual chrysanthemum show here November 12 and 13.

ERIE, PA.—A chrysanthemum show will be held here November 5 to 7. Premium lists can be had on application to H. Tong, P. O. box 220.

TARRYTOWN, N. Y.—F. R. Pierson & Co. will incorporate with capital of \$100,000. They will put a large amount into glass for cut flower growing.

NEW YORK.—The first autumn flower show occurred here October 9 at the American Institute Fair. A chrysanthemum show will be held at the same place later.

PHILADELPHIA.—Fred S. Krebs who lost 1341 feet of single thick glass by hail in the recent storm was insured in the Florists' Hall Association and his loss was promptly paid.

ST. LOUIS.—Henry Michel has withdrawn from the Michel Plant and Seed Co. and will start a greenhouse establishment at Marion, Ind. He will have the advantage of natural gas for fuel and good shipping facilities at the location selected.

SYRACUSE, N. Y.—The Central New York Hort. Society will give its first

annual chrysanthemum exhibition and flower show November 7 and 8 at Greyhound Hall. Premium lists may be obtained from Louis E. Marquise, secretary, Syracuse, N. Y.

WILMINGTON, DEL.—The florists of this city will give their first chrysanthemum show at Old-Fellows' Hall, November 14 to 16. J. L. Brown & Co. have just finished a new carnation house 75x15. L. E. Baylis has rebuilt two of his old houses. The heavy rains in September injured carnations.

DETROIT.—Preparations for the chrysanthemum exhibition November 12-16 are progressing finely. This is the first attempt to hold an exhibition of the kind here and the florists interested are Juo. Breitmeier & Sons, the Detroit Floral Co., Holznagle & Noel, S. Taplin and B. Schroeter. It will be merely a display by the florists named, there being no premiums offered and there will be no competition except friendly rivalry as to who can show the best plants.

OTTAWA, CANADA.—The Valley of Ottawa Gardeners' and Florists' Club was organized here last April and meets regularly on the second Thursday evening of each month in the Young Men's Christian Association Building. Following are the officers: President, Jas. Sorley; 1st Vice-President, Jas. Hickey; 2nd Vice-President, Thos. Elmit; Secretary, N. Robertson; Treasurer, C. Scrim. The membership fee is \$2. Subjects are proposed by any member of the club and the president selects some competent member to treat it. Discussion is open to all and questions are always in order. So far we have been most successful and have aroused a spirit of inquiry into things that were little thought of by many of us and the meetings are becoming most interesting.

NASHVILLE, TENN.—The prospect for chrysanthemums this season is not so good as formerly. For several seasons past all those growers who raised largely have lost money although many charitable organizations under the management of ladies, held annual chrysanthemum shows. Chas. Racknitz, furnished beautiful specimens last season, as also did G. W. Currey & Co. The market was over stocked and prices poor. This year all growers have abandoned the pot raised plants, and depending upon outdoor growth, allowed the heavy frost of October 6 and 7 to greatly injure all those plants not removed to cover. As a consequence there will be a scarcity of those beautiful blossoms. G. W. Currey & Co. under the management of Mr. R. B. Currey have greatly increased their facilities for supplying the cut flower trade in this city, erecting three new houses last summer, and planting several thousand rose plants. Mr. S. W. Johnson, recently with the above firm, has been and is still very ill with typhoid fever, at his home in Clarksville.

WASHINGTON.—The feature of introducing largely floral decorations on the occasion of their "Openings" which merchants resort to of late has been steadily gaining in favor here. The removal to a new place of business of one of the largest house furnishing firms in this city, afforded an occasion for an exceptional effort in this line, and the result has been the "town talk" for the past three days. The interior of the immense establishment of seven stories was hung over with garlands of smilax and asparagus, while groups of palms and ferns, with an occasional set piece in cut flowers, filled every

available space. But it was the large front window encased and arranged as a boudoir which displayed most effectively the master hand of Smalls the floral artists. The back ground constituted a semi-circular recess completely covered with potted Maidenhair ferns lying upon bevelled shelving; imbedded in the center some four feet above the floor was an oval mirror, below this base on an incline was imbedded another mirror bordered by clusters of lilies of the valley constituting a most attractive and unique foreground. On either side stood large vases made up of immortelles, filled, the one with La France the other with choice Niphetos. Dainty gilt chairs, settees, tables and stands on the softest of rugs, beneath lace curtains of marvelous workmanship and texture made up a *tout ensemble* such as the public is rarely privileged to see.

Coming Exhibitions.

November 5-8, Chicago.—Chrysanthemum Show Chicago Florist Club.

November 5-9, Indianapolis.—Chrysanthemum Show Society of Indiana Florists.

November 5-8, Montreal.—Chrysanthemum Show Montreal Florists' and Gardeners' Club.

November 6-8, New Haven, Conn.—Annual exhibition of the Chrysanthemum Club.

November 12-16, Detroit.—Chrysanthemum Show Detroit Florists.

November 12-16, Philadelphia.—Chrysanthemum Show Pennsylvania Hort. Society.

November 12-14, Boston.—Chrysanthemum Show Mass. Hort. Society.

November 12-14, Orange, N. J.—Chrysanthemum Show New Jersey Floricultural Society.

November 12-16, Cincinnati.—Chrysanthemum Show Cincinnati Florist Club.

November 13-14, Worcester, Mass.—Chrysanthemum Show Worcester County Hort. Society.

November 14-16, Springfield, Mass.—Chrysanthemum Show Hampden County Hort. Society.

INDIANAPOLIS CHRYSANTHEMUM SHOW, NOV. 5 TO 9 INCLUSIVE.

A statement to prevent any misunderstanding in regard to the "National Prize"—"MRS. HARRISON CUP."

1. Any unnamed Seedling Chrysanthemum of American origin, that has never been put on sale is eligible to competition.
2. Six Cut Blooms of such seedling shall constitute one entry.
3. Each person competing for the cup, whether with one or more entries, shall pay an entry fee of \$2. This includes membership for one year.
4. The judges of these seedlings are appointed by the National Chrysanthemum Society.
5. Blooms for contest must be staged by 6 P. M. on Tuesday the 5th.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED—By a housew. floral, and design maker; first class; German, single, 25 years old. Address HENRY REICHHOLZ, Greenman Avenue, Westely, N. Y.

SITUATION WANTED—By experienced, competent florist and gardener, at once. Private or commercial. Single, German, middle aged man. Address W. K. 411 Broome St., New York City.

WANTED—Florist and vegetable gardener to work on halves; sober, industrious and honest; must come well recommended. Married German preferred. Address H. S. Nud River, Clark Co., Ohio.

Chicago.

The annual election of officers at the last meeting of the Florist Club resulted in the re-election of the old officers as follows: James D. Reynolds, president; D. B. Fuller, vice-president; G. L. Grant, secretary; P. J. Hauswirth, financial secretary; Flint Kennicott, treasurer; Thos. Hopkinson, F. F. Benthley, A. McAdams, Jos. Curran and M. F. Gallagher, trustees.

Arrangements for the club's coming exhibition are now complete. A feature will be the parlor decorations, for which prizes of \$200, \$125 and \$75 are offered. An effort is being made to secure a committee of twelve well known society ladies and lovers of flowers to judge the floral work.

C. E. Pollard has started into the business in a small way at Mendel. He has built one house 40x24.

The floral decorations at the banquet tendered the Pan-American congress were very elaborate and were much "illustrated" in the daily press. Florists M. F. Gallagher and Walter Kreitling arranged them. A design arranged by the first named was a representation of a section of a globe bearing the outlines of the western hemisphere. It was made up of immortelles and Cape flowers and was much admired by the press representatives judging from their reports. Large quantities of choice natural flowers were however also used.

New Copper Labels FOR PLANTS AND TREES.

Absolutely Imperishable.

No string or wire required.

This label is made of Prepared Copper, extremely soft and pliable, and the name of the plant or tree is written or INDENTED easily with any pointed instrument. The inscription thus made is clear and distinct and will remain so as long as the plant lives.

SMILAX.

Strong plants, in 3-in. pots, \$2 50 per 100.

Joseph Hancock,
WYNCOTE, Mont. Co., PA.

St. Louis.

The floral display at the exposition was very creditable to the local florists. For best group of decorative plants the first prize of \$150 was awarded to Alexander Waldbart, second prize, \$75 to C. Young & Sons, third, \$50 to the Jordan Floral Co., and fourth, \$25 to Wm. Schray.

For parlor decoration C. Young & Sons received first prize, \$150; Jordan Floral Co. second, \$75; and William Ellison, third, \$50.

The first prize of \$100 for best table decoration went to Wm. Ellison, second, \$50 to C. Young & Sons and third, \$25 to the Jordan Floral Co.

For bridal bouquet first prize of \$25 went to the Jordan Floral Co., second, \$15 to Wm. Ellison, and third, \$10 to C. Young & Sons.

Messrs. C. L. Mitchell of Cincinnati, Chas. W. Reimers of Louisville and Robert S. Brown of Kansas City acted as judges.

MICHEL PLANT AND SEED CO.,
St. Louis, Mo.

PANSIES. QUALITY HIGH. PRICES LOW.

I attend personally to selecting the finest specimens only, for my seed bed, trying the various novelties and discarding those without special merit. Growing seed enough only to produce what plants I sell, I can make a finer selection than if grown in quantity.

From the sale of over **100,000 Plants** last season I have received numerous recommendations. Not one complaint.

PRICES : Good stocky plants from seed beds, 75 cents per 100 free by mail, \$5.00 per 1000 per express. Send for circular.

ALBERT M. HERR, Lock Box 338, Lancaster, Pa.

REMOVAL.

Friends will please notice that I have occupied my new printing house, which is ideally situated and fitted up for **HORTICULTURAL PRINTING**, with treble my former facilities, and plenty of room for extension. I am now ready to give better satisfaction than ever on Catalogues or any printing for florists, from the basis of a thorough knowledge of both flowers and printing. ADDRESS NOW

[Mention The American Florist.]

Minneapolis.

This season has so far been very favorable for those florists who are "a little behind." Several have been so far behind in preparation for winter that a good hard freeze would have done them serious damage and Minnesota has been known to freeze up even in September.

Every florist here seems to be very favorably impressed with steam for heating in this climate. Of the four new places built this year, every one is fitted with steam heating apparatus. Mr. Mendenhall has put steam pipes into a part of his houses without removing the hot water pipes; surely both will give enough heat, even for a Minnesota winter.

We would like to know the cost of heating in the east as compared with the west, and I wonder if the AM. FLORIST could not be prevailed on to receive figures of this nature and next summer publish a table showing the cost of heating in different sections of the country, by the different methods and different kinds of fuel. We do not believe the cost of heating per thousand feet is much less in the east than in the west, as the difference in the atmosphere probably more than compensates for the difference in degrees of cold. Possibly the cost of fuel may be in favor of the east, but the amount of fuel used must of course be the basis of comparison.

Roses are doing finely, so far in fact supply almost exceeds demand, which was never known here before. The favorable weather has undoubtedly forced the bloom along early and later they may not be as plentiful.

Chrysanthemums are just coming into flower with fine grown specimens in almost every house. The dry season here the past summer has made dwarf plants in some instances. S.

HUGHES

SOLUBLE FIR TREE OIL.

FLORISTS AND NURSERYMEN SHOULD NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants: such as ferns, etc., if used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

Arnold Puetz,

GREENLAND, FLA.

Floral Notes in the Daily Press.

A St. Paul florist writes: "Am very glad to see that you are attempting to make florists understand that in our business as well as any other we shall not create a demand for our goods by circulating exaggerated reports of high prices received. It is very good advice you are giving us when you say that every florist should do his best to let people know that flowers are sold at only a moderate advance over cost of producing. You see I have started the ball rolling by giving a reporter for a daily paper the points for enclosed item."

"I would further suggest that when a reporter comes in to interview you don't turn away with a short 'Have no time,' or something of that nature. Give him five or ten minutes of your time and a few sensible suggestions. It will pay every time."

We give the clipping below:

"It is very unfortunate that it is generally believed that cut flowers are very high priced, and that none but the rich can afford them. This is not the case in St. Paul, and at present, while the trade is dull, waiting to be revived and enlivened by the slowly approaching social season, flowers, and good flowers, can be purchased at exceedingly low figures. A prominent florist in this city said the other day that their trade had been greatly hurt by it being understood that roses were an expensive luxury, and newspaper reports, he believed, were largely responsible for this, as they often spoke of the great expense of certain floral pieces or decorations. At present roses are more in fashion than any other flower, and some of the best ones are but 1¢ per dozen, while the highest do not exceed 25¢."

MOORESTOWN, N. J.—Isaac C. Rogers has recently started in the florist business on a small scale. He has 500 feet of glass.

Florists' Letters.

Emblems, Monograms, Etc.

These letters and designs are made of the best materials, wired on wood or metal frames, having holes drilled in them to insert tooth-picks, by which they are fastened to the design. Give them a trial. You will find these goods to be superior to any in the market. PAT'D AUG. 6, 1890.

NOTE—All infringers or imitators of the above letters and designs will be prosecuted to the fullest extent.

IF YOU have anything to sell to florists, nurserymen or seedsmen, advertise it in the AMERICAN FLORIST and you will find a buyer if it is a salable article.

IF YOU have any trashy stuff you want to sell don't advertise it in the FLORIST, but if you have a good article and want to sell it at a fair price you can find buyers by advertising in these columns.

ADVERTISERS should bear in mind that the FLORIST is a strictly trade paper and that wholesale price lists may be published in its columns without fear that the wholesale rates there given will be seen by retail buyers. Subscriptions from those who are not in the trade are invariably refused by us. Among those in the trade, we include employees of commercial florists and private gardeners who have charge of greenhouses.

Chrysanthemum Show.

Chicago.

In spite of the week of dark weather which preceded it and many other drawbacks the Florist Club's exhibition was a decided success.

The center of the immense army was devoted to beds of chrysanthemum plants arranged in various forms in such a way as to allow a good view of them from every direction, all being placed on the floor; surrounding these and interspersed among them were tasteful groups of decorative plants forming a very happy combination. The bulk of the latter came from the greenhouses of J. T. Anthony, who while nearly emptying his greenhouses into the exhibition hall made no entries for competition. D. B. Fuller also displayed decorative plants and cut flowers not for competition. The tables for the cut flowers were arranged along each side of the hall.

The largest exhibitors of chrysanthemum plants were Mrs. S. P. Gardner, who received the special prize of \$100 for best display of named varieties, John Goode & Co., John Lane and Geo. Maclure, gardener for H. R. McCormick, each of whom received honorable mention. Messrs John Lane and John Goode & Co. showed some excellent plants and were not many points behind the prize winner, though Mr. Lane's plants were not entered for competition. Mr. Maclure's plants were small—from late spring cuttings—but had been admirably handled and the blooms were most excellent. They were also exceedingly well arranged and were a most attractive feature. D. B. Fuller had in the hall a bed of well grown Gloriosums, also a bed of white and pink varieties. Mr. Lane exhibited a yellow seedling which promises to make a place for itself.

In cut blooms E. Weinhoeber & Co. were especially strong showing some exceedingly well grown flowers and a large quantity of them. Messrs. John Lane and O. P. Bassett also showed some handsome cut blooms, a white variety shown by the latter was exceptionally handsome and many inquiries for its name were heard, but none could give it. Mr. Bassett says the label was lost from the plant and he doesn't know himself what it is. It strongly resembled Mrs. Alpheus Hardy without the hairy covering. Patterson & Wolcott and Jno. S. Forster each had a good showing of cut blooms, among the latter's being 18 seedlings worthy of notice. But the banner exhibit of cut blooms—as far as quality was concerned—was that of Pitcher & Manda, Short Hills, N. J. In this collection Mrs. Alpheus Hardy was of course the central figure and the blooms were a revelation to some of the local growers

who had been carefully nursing measly little flowers of the same variety. Some of them had been condemning the variety, but after seeing these blooms they walked quietly and thoughtfully away. Every one of the flowers in this collection was worthy of special mention, but space forbids, though we can not pass without mentioning Adirondack, a superb white, Ramona, a handsome yellow, La Tosca and Cythere, of shades difficult to describe. Siebrecht & Wadley, New Rochelle, N. Y., had among their orchids a few seedling chrysanthemums, among them a pink one which is certainly promising and all were good.

The displays of cut roses, carnations, violets, etc. were most creditable, while the collections of orchids shown by Siebrecht & Wadley, New Rochelle, N. Y., and the Neal Floral Co. of this city were decided attractions. The roses and carnations shown by E. Weinhoeber & Co. and O. P. Bassett were worthy of every commendation, and Jas. D. Reynolds was also to the front in roses.

But what proved to be a strong drawing card of the exhibition was the parlor and table decorations. For the former spaces about the size of the average parlor had been partitioned off at one end of the hall and these were most elegantly furnished and then decorated with plants and flowers by the various competitors. And how the ladies did flock in and how they did examine these beautiful rooms, and they were worthy of all the praise bestowed upon them.

That decorated by F. F. Bentley and which received the first prize of \$200, was a gem, particularly the mantel decoration. The mantel proper was most gracefully banked with fine ferns with a superb bunch of American Beauty roses in the upper left hand corner, while to the right was a most exquisitely arranged bunch of orchids. A scarf of old gold colored chrysanthemums hung from the mantel, while the grate was banked with ferns of bolder habit than those used on the mantel. Two corners of the room were occupied by groups of palms, and in another stood a small table bearing a tall vase of Bon Silene roses surrounded by adiantum ferns at the base. There was a slight draping of smilax around the room at effective points.

E. Weinhoeber & Co. received the second prize of \$125. In this room the mantel decoration was entirely of ferns, and it was a charming study in foliage contrast. Mr. W. J. Smyth, formerly of Boston, but now with Messrs. Weinhoeber & Co., did the arranging and should receive much credit for his admirable work, though for an every day decoration some flowers should have been added. The grate was banked with palms and ferns and no colors were to be seen in the entire mantel arrangement except shades of green. In two corners

of the room stood stands each bearing a small specimen palm with ferns at its base. In the other corner was an opera basket of Mermets on a stand, while on the center table was a large basket of handsome American Beauties. Smilax was very gracefully draped overhead and over the entrance and a few pictures on the walls added an effect missing in the other rooms.

The third prize of \$75 went to Charles Reissig who gave Messrs. Weinhoeber & Co. a hard push for second place, losing it by only a few points. Mr. Reissig's mantel decoration was also superb (in fact all three were so excellent that it was a hard matter to choose between them), it was a very graceful combination of small palms, ferns and orchids and the grate was filled with chrysanthemum sprays, palms and crotons. There were groups of palms and ferns in three corners of the room. On the wall to the right of the mantel was a panel of adiantum ferns with a bunch of Buttercup carnations in the center while on the opposite wall was a similar panel with a sash of Grace Wilder carnations running diagonally across its face, from which fell away on each side heavy curtains of smilax studded with carnations on one side and lily of the valley on the other. On the center table stood a bowl of American Beauty roses.

The strain of the lively competition in the parlor decorations was so great that only one came to the scratch with a table decoration the next day. That one was Chas. Reissig and of course he had a walk away with a very handsome arrangement consisting mainly of Mermets roses. There were three entries for the \$25 special for center piece for lunch table, which was taken by F. F. Bentley with an arrangement of La France roses and ferns.

Following is the list of other prizes awarded: Special prize of \$25 for best collection chrysanthemum cut blooms, named varieties, John Lane; best general display of cut chrysanthemum blooms, 1st \$25, E. Weinhoeber & Co.; 2nd \$15, Patterson & Wolcott; 3d \$10, John Lane; collection cut sprays in vases, one of a kind, 1st \$15, O. P. Bassett; 2nd \$10, Mr. Saxen; 3d \$5, John Goode & Co.; 12 naturally grown sprays, 1st \$5, John Lane; 2nd \$3, Jno. Goode & Co.; 12 blooms, one of a kind, 1st \$9, Goode & Co.; 2nd \$6, John Lane; best arranged basket in style \$20, F. F. Bentley; best arranged center piece for buffet table \$35, F. F. Bentley. In cut roses J. D. Raynolds received 1st \$3, for best 12 Mermets and Perles, and 1st \$5, for any new variety, 2nd \$1.50, for Brides, Bon Silenes and Contiers; E. Weinhoeber & Co. took 1st \$3, for La France, Brides, Bennetts, Cusins, Bon Silenes and Contiers, also \$5 for American Beauties and 2nd \$1.50, for Mermets and Perles; O. P. Bassett 1st \$3, for Niphetos and 2nd \$1.50, for La France, and 2nd \$2.50, for American Beauties. In cut carnations E. Weinhoeber & Co. received 1st \$3, for Grace Wilder and Garfield, and 2nd \$1.50 for Hinz's White; F. Timme 1st \$3, for Hinz's White; N. Singler 1st \$3, for Silver Spray; E. Weinhoeber & Co. 1st \$3, for double violets; Neal Floral Co. special prize of \$25 for cut orchid blooms.

The special of \$25 for best general display of cut roses on the third day was captured by E. Weinhoeber & Co. Their American Beauties and Bennetts were especially fine and the whole display was a credit to the exhibition. Geo. Klehm won 1st, \$5, for lily of the valley, and also displayed some La France roses

which would have made his exhibit a feature of the show had they not been removed from the building by an officious employe, without authority, shortly after the awards were made.

H. A. Dreer, of Philadelphia, made an attractive show of palms and ferns of trade sizes, and Fisher Bros. & Co., of Montvale, Mass., showed Adiantum cuneatum and Farleyense. Mr. Dreer's exhibit was in charge of Mr. W. Mott, who was pressed into service as one of the judges of plants and cut flowers.

The method of judging the floral arrangements was quite a departure. After some consideration on the part of the club it was decided that none could be better judges of such work than their best patrons and especially those known to the florists as lovers of flowers, and with some doubt as to whether the services of such could be secured invitations were sent out to a score of the best known society ladies in the city; eleven accepted and made an admirable committee, performing their duties carefully and conscientiously, and all expressed themselves as very much complimented by being selected for the duty, and the value of such an award to the lucky recipient can be readily appreciated by those in the trade.

Indianapolis.

The third annual chrysanthemum show of the Society of Indiana Florists was opened with a graceful speech by Mrs. Mayor Denny, who in well chosen language spoke words befitting the occasion and scene. Our President, M. A. Hunt, fittingly responded and in a few minutes talk set forth the educational and refining influences which follow the exhibition of flowers such as was presented in the hall that night.

Interest at once centered in the contest for the National Prize, the cup offered by Mrs. President Harrison. There were 24 entries for this prize, five by Mr. T. H. Spaulding, two by John Thorpe, one by Henry Reiman, one by Hill & Co., 14 by Fred Dörner and one by John Hack. It was found necessary to use the word "undisseminated" instead of "unnamed," as published in the FLORIST, as nearly all the seedlings came named. The variety "Ada Spaulding" was finally decided the winner by several points, but it took the judges a long time to decide, so excellent were five or six others among the seedlings exhibited.

Mistletoe (Dörner), a whorled incurved of a most peculiar shade, silvery mauve upper side of petals a deep wine; Emily Dörner (Dörner), bright amber yellow, heightened in color at the center; Mrs. Benjamin Harrison (Spaulding), a magnificent variety of the Mrs. Wheeler type; Cyclone (Spaulding), a large whorled incurved, white, a flower of splendid size and substance; E. G. Hill (Spaulding), a large reflexed variety, bright orange yellow shaded slightly with carmine; Rosebank Gem (Thorpe), reflexed Japanese, eight inches in diameter, color a violet shaded heavily with lavender; Clara Reiman (H. Reiman), silvery rose in color, suffused with light yellow—a pleasing hue—of fine form. All the above were awarded "certificates of merit," and can be depended on as being first class in every respect. The judgment of the committee was that the balance of the entries be given another year's trial before offering for sale, which was acquiesced in.

Triumph de Exp'n Marseilles, a French variety of this year, was awarded a certificate also. It is novel in form, peculiar

in color and well worthy the distinction accorded. It belongs to the reflexed section and is of a brown yellow color. The utmost care and caution was exercised by the committee who made the awards, and the varieties certificated can be depended on as being superior varieties.

Pot plants, best 25, 1st Henry Reiman, 2nd Fred Dörner, 3d Hill & Co., 4th Bertermann Bros. This was the "striking" exhibit of the show and it is only just to say that all the exhibits were creditable and well flowered. It will interest the readers of the FLORIST to learn the names of the most prominent varieties in the four entries for this premium: T. C. Price, Lillian B. Bird, Mary Wheeler, Mrs. Irving Clark, L. Canning, Miss Esmerelda, M. Boyer, W. H. Lincoln, Tokio, Duchess, Puritan, Richard Elliot, Cullingfordii, Frank Willcox, Mrs. A. Blanc, Walter Coles, J. Collins, Kioto, Lucrece, Mrs. Geo. Bullock, W. H. Singler, Mrs. E. W. Clark, Sunset, Mrs. C. H. Wheeler and Marvel.

L. Canning and Miss Esmerelda are ideal exhibition plants for growing in pots, and the nearer a variety conforms to these in general characteristics the more effective they are.

Mr. H. W. Reiman's plants were deservedly first, being of even growth and finely flowered. Mr. Reiman was first with best 10 whites; the most pronounced varieties were Puritan, L. Canning, Jessica, Robt. Bottomly and Boule d'Neige. He was also awarded the prize offered by Elverson, Sherwood & Barker, of the New Brighton pottery works, for best 10 plants introduced in '88, they were Richard Elliot, L. Canning, Mrs. E. W. Clark, Delie, Dr. Metzger, Dr. Stryker, Madam Drexel, Walter Coles, Mrs. A. Blanc and Mrs. Isaac C. Price.

Fred Dörner was first with best 5 standards, first with best 5 yellow, and first in 5 best pink, also took first in the class for 5 best red and bronze.

Bertermann Bros. took the prize offered by Hill & Co. for best 12 varieties of this year's American raised novelties. The varieties were Miss Esmerelda, Tasaka Kaka, Golden Star, Miss Mary Wheeler, Mrs. Irving Clark, Nessima, Excellent, T. C. Price, Llewellyn Violet Rose, Sunset and Mrs. Anna Hartshorn.

Excellent specimens of Mrs. Alpheus Hardy and Mrs. Andrew Carnegie were shown by H. W. Reiman, taking the prize of \$5 for best specimens of these noted varieties.

The award for best 300 cut blooms in 25 kinds, 12 flowers of a variety, was given to Mr. John Rose, gardener to F. T. McFadden, of Cincinnati, Ohio. Mr. Thorpe and other competent judges declared them the finest lot of cut blooms ever staged in this or any other country. An idea of their size may be formed when it is stated that many of the varieties were exceptionally large and most beautifully colored. Mention might be made of a few: Cullingfordii, 4½ inches over; Mrs. E. W. Clark, 9 inches; Mrs. A. Hardy, 6 inches; Mrs. Irving Clark, 9 inches; Mrs. Langtry, 9 inches; W. W. Coles, 10 inches; G. F. Moseman was the size of John Sullivan's boxing gloves; Marvel, 8 inches; and in fact the smallest in size was Cullingfordii mentioned above. The flowers of the different varieties were uniform in size and of most excellent quality. The collection was a grand exhibit of what can be done by good cultivation and reflects great credit on Mr. Rose. H. W. Reiman and Hill & Co. followed in order named. A few fine varieties were noted in the above as

WILLIAM H. SPOONER, PRESIDENT MASS. HORT. SOCIETY

follows: Kioto, Alpheus Hardy, L. B. Bird, W. H. Lincoln, H. Cannell, Mrs. Fottler, C. Orchard, Robt. Craig, George Atkinson, Mme. Louis Leroy, Mrs. W. K. Harris, Excellent, Mrs. I. Clark and Sunset.

Hill & Co. made the only entry for 50 French and English sorts. This was filled by entering the number called for, though this does not imply that they were 50 fine sorts by any means, on the contrary a good part of them should speedily be consigned to the rubbish heap. Exceptions that may be noted as good and distinct: Tri. de Exposition de Marseilles, Mme. Ed. Andre, Countess de Mun, Mme. Leveque, Countess de Paris and Mme. C. Richard among the French; Sunflower and Mr. C. Orchard are promising English varieties.

The New York prize offered by Peter Henderson was won by Mr. H. W. Reiman, who displayed good judgment and taste in his arrangement of his collection. Many varieties were shown, but did not differ materially from those mentioned in classes named above.

The first question asked by most of the growers present was, "how do the new varieties of this year compare with the old and more recent introductions?" Unquestionably many of the novelties of this year are decided acquisitions and distance the older ones in their respective colors and classes. Mrs. T. C. Price was considered by most to be the finest variety exhibited, it is certainly deserving of much praise; Mrs. Irving Clark, Lillian B. Bird, Mrs. Burpee, Kioto, Violet Rose, Mrs. A. Hartshorn, Excellent, Mary

Wheeler, Sunset, Mrs. Hardy and Mrs. A. Carnegie jump at once to the front as valuable.

The banquet and toasts were all in keeping with the excellent arrangements made by the committee, who are greatly indebted to Mr. Williams for untiring efforts to make everything pleasant and successful.

The judging was done by J. M. Jordan, our honored President of the S. A. F., and by that Prince of Florists "Uncle John" Thorpe. Mr. Thorpe being a competitor for the Mrs. Harrison cup, Mr. F. T. McFadden and John N. May did duty with Judge Jordan in deciding the National Prize.

A conference was had on the chrysanthemum, its culture, nomenclature and various items pertaining to exhibitions, the certificating of seedlings, etc. John Thorpe was never happier and never more willing to impart to others the benefit of his experience and counsel.

The designs were all excellent, and as far as designs can be were nicely made, the handwork on many of them being quite creditable.

Carmony as a poet is a grand success, as witness his effort on the menu card.

The Short Hills Show.

Among the autumn shows none can be more interesting than the recent display at the United States Nurseries. The invitations modestly called attention to an exhibition of orchids and chrysanthemums lasting from the 4th to the 9th of November, but it goes without saying,

that there were many interesting features outside of these two classes. The exhibition houses were arranged with infinite taste, fully demonstrating the advantages possessed by a greenhouse over any ordinary hall, especially in the matter of light.

Chrysanthemums are of course the first interest at this season, though the unfavorable summer has resulted in much disappointment. One naturally expected to see a good display of Mrs. Alpheus Hardy in this its first American home, nor was the expectation disappointed. The entire middle bed of the large chrysanthemum house was filled with this variety, represented by above two thousand plants. It is indeed a beauty; the blooms seem more uniformly fine than last year; probably the plant is improved in constitution. It is evidently a very tall grower; some of the large plants seen appeared to be about ten feet high. It is noticeable for its long stems, making it admirable for cutting; it is always seen with a single bloom to a stem, never in clusters. As for its purity of color and harmony of shape, and its snowy, downy texture, it has all been described often enough, though it can never lose its merits by repetition. Judging from a recent note in the *Garden* this variety has not done so well in England as here; the writer says that he only knows one grower who has any prospect of seeing the plant in good condition, but over-propagation is regarded as the cause of this disappointment.

Among new chrysanthemums, Dr. Walcott's group, as noted at Short Hills, is certainly of great promise; it contains several whites, which, apart from intrinsic beauty promise great things for the cut flower trade, for they show large flowers on long, sturdy stems, clothed with good foliage right to the top. Another good point about these plants is the simplicity of their names; they are good, honest American names, simple and distinct. Shasta is a large clear white, very full petalled; an early bloomer. Adirondack another very good white. Monadnock is a large, tubular-petalled yellow, remarkable for its lasting qualities. Ramona is another fine yellow, a very clear golden tint. Cortez a large dark flower oddly flecked with gold. Kioto, the grand yellow exhibited by Mr. Fewkes last year, more than fulfills its early promise, and so does Lillian B. Bird (awkward name, by the way). Mrs. Fottler, the lovely pluk so much admired last year, is still unapproached in its own peculiar tint.

A set of new varieties, as yet unnamed, received from Japan, show some promising novelties, and there are interesting seedlings from Mrs. Alpheus Hardy—all sorts of colors, but never a hairy one among them. One of them is a large pale pink bloom, the color rather suggestive of a La France rose.

An interesting French set of chrysanthemums contains some excellent early flowering sorts; Belle Pointeview, a good white Chinese, and La Fortune, a beautiful yellow, were very attractive. Mrs. Andrew Carnegie hardly bore out its former glories—the colors seemed dim when contrasted with brighter varieties. Very few anemone-flowered varieties were seen; the large Japanese and Chinese take the best.

One hardly expects to see much in the way of orchids at this season, but Short Hills is very fortunate in this respect, and there were some veritable gems in bloom. The great attraction was a fine plant of the superb *Vanda Sanderiana*, bearing

three spikes of bloom, twenty-four flowers in all. It was not only a very fine plant, but also a very fine variety, being remarkable for depth of color. The upper part of the flower displayed the lilac of a cattleya, contrasting wonderfully with the deep crimson veining beneath.

Highly unique was *Lelia Eyermaui* alba, the only specimen known to be in existence. Other interesting *Lelias* were the colored form of *L. Eyermaui*, *L. Gouldiana*, and *L. autumnalis* alba.

The display of *Cypripedes* was naturally very fine, including many rare forms. Among them was the unique *C. Masarelianum*, *C. Arthurianum*, *Schroderae*, *tessellatum*, *porphyreum*, *magniflorum*, and many others. *C. bellatulum* is a beautiful form; it is one of the few *Cypripedes* in which the lip is insignificant compared with the rest of the flower. Its color, a bluish, tinted white, spotted distinctly with deep crimson, makes it very noticeable.

The masses of *Cypripedium insigne* promise in all some 18,000 blooms, and there is any number of *Harrisianum*, *Lawrenceanum*, and *Sedenii*.

Vanda coerulea was noted in very fine variety—a very deep tint; there was a miscellaneous lot of good orchids, charmingly arranged.

In a group of *nepenthes* the very rare and beautiful *N. linata* was noted; it is remarkable, not only for its rarity, but also for the size and beauty of its pitchers. A rare *cycad* was *Zamia pumilus*, a very prickly-looking plant with glaucous leaves; a fine specimen is to be seen here.

Two new forms of the climbing asparagus were noted; a very feathery variety of *A. plumosus nanus*, and a variety with singular drooping leaves, *A. decumbens*.

The display of *anthuriums*, palms, pandanus and other decorative plants was fine and very tastefully arranged. A tremendous stock of cattleyas was to be seen, which will make a grand show later on. It is the intention of this firm to give an orchid exhibition during the winter; the number of plants then in bloom will mount up into the thousands, and it will no doubt be a success as unqualified as the show now under discussion, which was certainly worthy of all praise.

EMILY LOUISE TAPLIN.

Montreal.

The first chrysanthemum show of the Florist Club which opened November 5 was far ahead of anything of the kind even seen in this city, and considering the unfavorable season was a very creditable show, though it will undoubtedly be improved upon another year.

The local papers were very free with favorable comments, the weather was all that could be asked and the attendance was good.

The first prize for 12 specimens was taken by J. Kirkwood with the varieties: *Ceres*, *Tokio*, *Mme. Delaux*, *Source d'Or*, *Gloriosum*, *Bouquet Fait*, *Mme. C. Audiguer*, *Fair Maid*, *Rubra striata* and *Elaine*. The same grower took first prize for 3 tasseled, with *Gloriosum*, *Mme. C. Audiguer* and *Rubra striata*. J. Bennett was 1st for single specimen any variety with *Gloriosum*. For the best bank, *Wiltshire Bros.* were 1st with a nice lot of plants, among which were *Duchess of Connaught*, *Mme. M. Fabre*, *Fabias de Maderanaz*, *Golden Empress of India*, *Mrs. Howe*, *L'Isle de Plaisir*, *Elaine*, *Source d'Or*, etc.

In cut blooms P. McKenna & Son were first with good blooms of *Mrs. Humphreys*, *Pres. Arthur*, *Lord Derby*, *Gloriosum*, *Peter the Great*, *Source d'Or*,

Golden Prince, *Comte de Germiny*, *Fimbriatum*, *John Welch*, *Mons. Bouchardet*, and *Ductess*.

There was a good display of cut roses. J. H. Dunlop, of Toronto, sent some fine blooms of *La France*, *American Beauty*, *Puritan*, *Mme. Hoste*, *Mme. de Watteville*, *Primrose Dame*, and others. The exhibits from local growers were very good, some *Brides* and *Cooks* from J. Bennett being extra good, while P. McKenna had fine *Beauties* and *Gontiers*. E. Graves, *Wiltshire Bros.* and C. Campbell also had good lots. In carnations Garfield was the best red, *Grace Wilder* for pink, while *Silver Spray* was first as a white; a fine vase of *Andalusia* was shown by P. McKenna & Son.

A very nice table was shown by W. *Wiltshire*, gardener to Hon. J. C. Abbott, among which were fine plants of *Cypripediums*, *vandas*, *calanthes*, etc. J. Doyle, gardener to W. R. Elmenhorst, J. Dunbar, gardener to H. M. Allan, J. Betrix, gardener to A. Allan, and W. *Wiltshire* sent a number of plants to decorate the hall, which added greatly to the effect.

Following is the list of awards: 12 chrysanthemums, 1st J. Kirkwood, 2d *Wiltshire Bros.*, 3d J. Bland; 3 chrysanthemums, reflexed, 1st J. Kirkwood; 3 chrysanthemums, tasseled, 1st J. Kirkwood, 2d J. Bennett; 1 chrysanthemum, specimen, 1st J. Bennett, 2d J. Kirkwood, 3d *Wiltshire Bros.*; standard, 1st *Wiltshire Bros.*, 2d J. Kirkwood, 3d J. Bland; 6 in 5 inch pots, 1st J. Bennett, 2d Geo. Trussell, 3d J. Eddy; bank of chrysanthemums, 10x4 feet, 1st *Wiltshire Bros.*, 2d J. Bland, 3d J. Bennett; bank of chrysanthemums, 6x4, 1st J. Eddy, 2d P. McKenna & Son, 3d *Wiltshire Bros.*; 3 *Primula obconica*, 1st J. Welch, 2d P. McKenna & Son, 3d J. Bennett; 6 carnations in pots, 1st P. McKenna & Son, 2d B. T. Graves, 3d C. Campbell; 6 geraniums in pots, 1st *Wiltshire Bros.*, 2d Geo. Trussell; 2 *solanums*, 1st *Wiltshire Bros.*, 2d C. Campbell, 3d J. Bland; 1 *Salvia splendens*, 1st J. Welch, 2d T. Wootton, 3d J. Eddy; 3 flowering begonias, 1st J. Bennett, 2d *Wiltshire Bros.*. Cut blooms: 12 chrysanthemums, 1st P. McKenna & Son, 2d *Wiltshire Bros.*, 3d J. Bland; 6 chrysanthemums, reflexed, 1st *Wiltshire Bros.*; 6 chrysanthemums, tasseled, 1st *Wiltshire Bros.*, 2d P. McKenna & Son; 6 pompons, 1st P. McKenna & Son; 6 roses, C. Mermet, 1st J. Bennett, 2d C. Campbell, 3d B. T. Graves; 6 roses, *Brides*, 1st J. Bennett, 2d *Wiltshire Bros.*, 3d C. Campbell; 6 roses, *Perles*, 1st J. Bennett, 2d P. McKenna & Son, 3d *Wiltshire Bros.*; 6 roses, *Gontiers*, 1st P. McKenna & Son, 2d J. Bennett, 3d *Wiltshire Bros.*; 6 roses, *Niphetos*, 1st J. Bennett, 2d B. T. Graves; 6 roses, *Woottons*, 1st J. Bennett; 6 roses, *Beauties*, 1st P. McKenna & Son; 6 roses, *Cooks*, 1st J. Bennett; 12 carnations, white, 1st P. McKenna & Son, 2d *Wiltshire Bros.*, 3d C. Campbell; 12 carnations, red, 1st P. McKenna & Son, 2d C. Campbell, 3d *Wiltshire Bros.*; 12 carnations, pink, 1st P. McKenna & Son, 2d C. Campbell; collection of *bouvardia*, 1st *Wiltshire Bros.*, 2d P. McKenna & Son; 3 varieties of *bouvardia*, 1st *Wiltshire Bros.*.

Germantown, Pa.

The display at the chrysanthemum show eclipsed that of last season in every particular.

The following first premiums were awarded: Private gardeners' list for collection of 12 plants, Jos. Shaw; collection of 6 plants, Wm. Beasley; collection of 3 plants, Jos. Shaw; single specimen, yel-

low, M. Clifford; specimen plant, white, M. Sammon; specimen plant, any other color, M. Sammon; nurserymen and florists' list, first, for 12 plants, *Woltemate Bros.*; collection of 6 plants, *Woltemate Bros.*; collection of 3 plants, *Woltemate Bros.*; specimen plant, yellow, Thomas Meehan & Son; specimen plant, white, *Woltemate Bros.*; specimen plant, white, *Woltemate Bros.*; specimen plant, amateur's list, collection of 3 plants, B. S. Phillips; specimen plant, any other color B. S. Phillips; list open to all, collection of at least 6 seedlings, M. McCleary; best seedling specimen, M. Sammon; 6 standards, *Woltemate Bros.*; design of cut flowers other than chrysanthemums, J. W. Young; design of chrysanthemum blooms, *Woltemate Bros.*; collection of 24 cut roses, six varieties, Edwin Lonsdale.

PLYMOUTH, MASS.—A few gentlemen interested in chrysanthemums held an exhibition at Plymouth on Tuesday, Wednesday and Thursday, November 5, 6 and 7. The hall was filled with plants that showed a great amount of care and attention and the show reflected a great deal of credit upon the promoters, Messrs. Hubbard and Robinson. Prizes were awarded for the best display to Mr. Robinson, second best to Miss Jackson, third best to Mr. Stranger. For the best plant, Mr. Hatch.

SYRACUSE, N. Y.—The first annual chrysanthemum exhibition and flower show of the Central N. Y. Hort. Society, November 7 and 8, was a most creditable display, said by good judges to be a decided advance on any previous exhibition seen in this city. In addition to the exhibits from local growers which were excellent, especially that of L. E. Marquise, there were some beautiful specimens of cut flowers from Pitcher & Manda, Short Hills, N. J.

CHARLESTON, S. C.—The chrysanthemum show, held November 5 to 8, greatly surpassed all previous exhibitions of the kind given in this city. There was a fine display of well grown chrysanthemum plants of the newer varieties and the exhibits of cut chrysanthemums and roses were exceptionally excellent, many of the latter being shown by exhibitors from surrounding cities who carried home with them many of the prizes.

ERIE, PA.—The Chrysanthemum Club's exhibition November 5 to 7 was a most gratifying success, the display being described by the local press as far surpassing any similar exhibition ever seen here. The principal exhibitors were H. Tong, W. Niemeyer, Titus Berst, E. Newburger, John Roberts and Mr. Hansman, of this city, and Welch Bros., of Boston, and E. S. Bartholamew, of Westfield, N. Y.

ATLANTA, GA.—The chrysanthemum show held in the rotunda of the new Capitol November 5 and 6 was an excellent display. Admission was free and the attendance was large. In addition to the local exhibitors W. B. Woodruff, Macon, showed 200 excellent plants.

SCRANTON, PA.—There was a large attendance at the chrysanthemum exhibition given by Clark & Co. at the armory, which was an excellent display and was much complimented by the local press.

IF YOU HAVE not personally reported to us the branch of the business you are engaged in and the number of feet of glass on your place, send it in at once so that you may be correctly classed in our new trade directory. Don't wait, do it now.

URN FILLED WITH FLOWERS.

Urn Filled with Flowers.

In this we endeavored to maintain the outline of the urn. A plant of English ivy was plunged into the moss and the vine carelessly twined around the body of the urn. A few cypripediums scattered through the vine gave rather a pleasing effect. One of the bad features is the wired candidum lilies; necessity compelled this. The effect would have been much better had they been on their own stems. Clusters of mignonette, La France and Meteor roses, carnations, lily of the valley, stephanotis were the flowers used.

H. H. BATTLES.

William H. Spooner.

PRESIDENT-ELECT OF THE MASS. HORT. SOCIETY.

Mr. Spooner was born at Jamaica Plain, Roxbury, Mass., (now a ward of Boston), his ancestors were of the old settlers in this section; he is now 56 years of age.

His early life was spent on his grandfather's farm, or perhaps more properly a market garden. At the age of 17 he went to New York City, where he was employed in the wholesale iron and nail business; the close confinement impaired his health so much that at the end of two years he returned to Jamaica Plain, and when his health was renewed started

in the nursery business, in which he has since continued. For the past ten years he has devoted his time to the growing of garden roses, on which he is an authority.

He has been a member of the Mass. Hort. Society since 1855, has served on many of the standing committees, was chairman of the plant and flower committee for seven years, is now a vice-president and member of the executive committee.

Mr. Spooner was a Representative in the State Legislature for 1884-5 of the ward in which he lives, was a member of the Committee on Agriculture and House Chairman of that committee in 1885.

He is a very good presiding officer and is admirably fitted by experience and temperament to preside over the deliberations of the Mass. Hort. Society. He assumes the office under most flattering circumstances, having been elected by a very large majority, and he will no doubt have the support and co-operation of every element in the society. W. J. S.

[See portrait, page 155.]

New Gladioli.

The able and practical paper by Wm. Falconer in the September number of the AMERICAN FLORIST has reminded me that we have something here in Sonoma county, California, worthy of

the attention of the lovers of this superb flower. Something we may say gotten up by long persistent efforts and skill, to exactly fill a floral niche in this magnificent climate. I refer to the new seedling gladioli (the word gladioluses seems awkward and incorrect; how would stratum and stratum sound?) grown at Santa Rosa, Sonoma county, California, by Luther Burbank.

Mr. Burbank has devoted a life's work to the growing of new things, and has had wonderful success in gaining hybrids between distinct species, of hundreds of fruits and flowers, many of them between species that ten years ago a man would have been considered "a dead gone crank" if he had intimated that such hybrids could be obtained. I know this for I "have been there myself."

He has to-day growing, with many of them in fruit, hybrids between nearly all the different species of the almond family, between nearly all the species of the blackberries and raspberries, and between the different species of each, and also the dewberries. Some of these are not only exceeding curious, but of wonderful vigor, productiveness, size and quality of fruit, I would say that his best dewberries and raspberries exceed all the older varieties at least four times in productiveness, and are all that could be asked for in size and quality of fruit. These are only examples of what he has been doing, nearly every known fruit and flower that can be made to grow "in this California climate" has been manipulated, species ripped up, broken up and "taken through a course of sprouts," until a botanist who should view the "remains" could hardly find a whole plank large enough to place his feet on.

As one example of his work, he has grown from the choicest seed, selected from every species and strain over one hundred thousand roses; from these he selected with the utmost care 25,000 and flowered them, and I saw them in bloom at three different times this season. And though I am no florist I know that there were some "good ones" among them, and that the square acre of new seedling roses all in bloom was a goodly sight.

Mr. Burbank's first success was Burbank's seedling potato, grown by him as a boy while in old Massachusetts and introduced by J. J. H. Gregory. The Burbank still "takes the cake" in many portions of the country.

We now come to his "gladiolus-es." The gladioli were early a favorite flower on this coast, but the old varieties all had two serious faults. In our richest of rich soils the stems grew too tall (here we have a gentle, sometimes increasing to a strong steady wind nearly constantly in summer, generally from one point of the compass, which was hard on these tall slender stems), and the flowers were scattered too much on the stems, also they were not large enough and not enough of them in bloom at one time. Mr. Burbank set himself to the task of remedying all these defects, with one other very prominent one here under our bright skies, namely, the flowers of the old strains did not well withstand this bright sun and drying wind. Well, he grew thousands and thousands of seedlings, hybrids of the different species, crossed and recrossed the varieties, with the result that every defect has been eliminated, and he has a new creation, embodying in perfection and every point sought for, and more. He has doubles of the largest size, perfect in color and markings. He has strains of nearly all colors of the largest of flowers, so closely

ranked that the flowers seem to be ranked in four rows on the stem, and best of all, flowers to the tips of the canes, so close together as to give the extremity of the flower stem a perfect solid cone of flowers, the petals entirely hiding the stem on all sides. The individual flowers are simply immense in size, we found numerous ones of many varieties five and one half inches from tip to tip of petals, with colors of every kind and markings known to the species. As to the size of the flowers I will say I visited many gardens in Santa Rosa and Petaluma which had in bloom I may say nearly all of the older choice varieties and the largest flower found was four and a quarter inches across the petals, the average being about two and a half inches, and then having all the care that rich soil, culture and water that could be given them, while the Burbank seedlings were growing in crowded rows on light sandy soil and no irrigation.

Mr. Falconer speaks of "grand flowers with stems five and six feet tall," Mr. Burbank bred for an ideal plant with a stiff short stem able to support itself in a windy country with stems two and a half to three feet and a half high, and he got it. Again the finer old sorts were too ephemeral, would not withstand the sun with their thin petals. Mr. Burbank bred for thick fleshy porcelain petals that would withstand bright sun and buffeting breezes and he got them.

And so it seems to be nearly all the way through. He has developed nearly everything he has tried for. He has thousands of new things, some of them truly wonders, as an example has 10,000 new varieties of potatoes selected from tens of thousands of seedlings. I will close by saying, please do not burden Mr. Burbank with inquiries. He is a very busy man, and has nothing for sale except such things as he advertises each autumn in his list of novelties. If you wish to know anything about California, or any point or thing in it write to me (inclosing stamps) and I will answer, for I am here nursing "a sore thumb" and have an abundance of leisure.

Petaluma, Cal. D. B. WIER.

Tuberous Begonias.

ED. AM. FLORIST:—The points you have recently noted in favor of Tuberous Begonias are timely and well taken. In many respects they are the most valuable bulbous plants of recent introduction. Their easy and rapid growth make them adapted for general planting and they must soon be nearly or quite on a footing with geraniums and other common summer plants as to cost.

Our friends in Europe have quite the start of us here, both in the quality and quantity grown. In a trip through England, France and Belgium the past summer I saw thousands of these begonias, some of the selected named varieties having the most beautiful flowers I have ever seen. In Belgium the collections were especially fine—the flowers enormous in size and particularly rich and brilliant in color. These were selected from thousands of seedlings gradually improved by careful hybridizing. In Europe as here the value of these plants for bedding out purposes is just beginning to be appreciated. Next season there will be immense quantities used for this purpose and I apprehend with the most satisfactory results.

Certainly anything new with the wealth of color and beauty of the tuberous begonia is most welcome, even if to

supersede only in part the stiff formal effect so frequently produced with most summer bedding plants now in use.

New York. FRED W. KELSEY.

Chrysanthemums Out of Doors.

In the Southern States, also in mild localities along the coast excellent chrysanthemums can be grown and bloomed out of doors, and that too without any protection whatever in the form of glass, muslin or other roofing while they are in flower. At the same time I am well aware that perfection can only be obtained by using some protecting material in fall, or growing the plants indoors.

Our place is right on the edge of Long Island Sound, hence the weather in fall is very moderate, and we usually have a fine display of chrysanthemums outside till the middle of November. This year so far, November 5, we have had only one very slight frost.

We now have over 200 varieties in bloom out of doors and just where they had been grown all summer, and right here a few general observations may be pertinent: Chrysanthemums outside love sunshine and open their blossoms much better for it, they love plenty room, and pay for it in sturdy bodies and good foliage; good soil for good growth, and moisture while growing and swelling their buds; they love shelter from winds and demand the support of stout stakes, but one stake to a plant is enough, and from the first they should be securely but not tightly tied up to the stakes. And especially when they begin to set their buds and open their blossoms is staking necessary, for about this time we often have violent storms. And it is visible throughout the whole range of plants, and year after year it is the same, namely, that strong plants in fall are always the result of strong young plants in spring, and the miserable, hide-bound things are mostly the result of weak, slender, hide-bound stock in spring.

But all chrysanthemums don't do well out of doors; some may grow well one year and fail absolutely the next, and some that grow well don't open their flowers well or enough of them. The pompons and Japanese sorts seem to do better outside than do the Chinese varieties, particularly the incurved section, many of which succumb to mildew. And I haven't found many anemone-flowered sorts to open as perfectly out of doors as indoors. Again, we grow what is in most demand, and I can assure you the largest flowers are the most appreciated, and for this reason we have to ignore many pretty pompons and all except perfect blossoms of the Chinese; the big, full Japanese are the favorites. This gives an impetus to disbudding. Six weeks ago it seemed as if we were stripping off too many buds, to-day we wish we had stripped off more, for there is more credit in one big perfect blossom than in half a dozen middling ones.

All things considered, the following are the best varieties now in bloom out of doors with me—every one of them is

healthy and vigorous and carrying a full crop of perfect flowers, or, as in the case of Cullingfordii, perfect buds: Elaine, Domination, Nevada, Moonlight, Jessica, Snowstorm, Lady St. Clair, Elsie, Ceres, M. Boyer, Mrs. E. Gilmore, Ile Japonaise, Gloriosum, Golden Dragon, Peter the Great, Golden Prince, Gloria Mundi, Baron Beust, Bronze Shield, Source d'Or, Red Dragon, Olympia, Lakme, Julie Lagravere, Cullingfordii, Hon. J. Welsh, and Mrs. Vannaman.

In a favorable locality like this there is a great deal of pleasure in raising chrysanthemums from seed, for by sowing in February or March I can bloom most every plant out of doors next fall, and only select for the following year's trial the very choicest of them. First year seedlings, as a rule, have a capital constitution and bloom prodigiously, and some of them are very handsome, but of course only a small percentage will be worth keeping over. Some of my very best chrysanthemums out of doors are my own seedlings, which, although excellent for this purpose, are not good enough to name and disseminate.

Glenn Cove, N. Y. WM. FALCONER.

Boston Notes.

The November meeting of the Gardeners' and Florists' Club was largely attended and the subject selected for discussion, "Chrysanthemums," brought out a most interesting debate.

The discussion was opened by Mr. E. A. Wood and was participated in by Wm. Edgar, W. H. Elliott, W. H. Knapp, Chas. Saunders and other local chrysanthemum growers.

Mr. Wood read a list of varieties which he had found best adapted for the various purposes of early, medium and late blooming for cut flowers and for pot plants. Speaking of plants for sale he said his experience was that they are difficult to dispose of after November 15, and advised against growing late kinds for this purpose. In growing plants for exhibition purposes he had found it best to grow exclusively in pots from the time they left the cutting bench, topping them first when three or four inches high, and repeating the operation when shoots were three inches long, up to July 15 when the last pinching should be done and the plants should be then 18 inches high and level across the top. From open ground he pots in latter part of August. He prefers a dry year when there is no wind and gets best results when the soil is dry and easily shaken out from the roots.

When growing cut blooms for exhibition he takes cuttings all the way from January 1 till March 15, but finds that the best blooms are invariably obtained from the earlier cuttings, and from those plants that have been kept in pots all summer without any shifting after July 1. Blooms from such plants have more substance and keep better. He has better success with "crown buds" than with "terminal buds." The terminal bud is often larger, but is more apt to be imperfect and has less body.

Wm. Edgar who has made quite a success in raising early blooms for market said that the best varieties for this purpose are Mme. La Croix, white, and Geo. Gordon, red. He grows his plants outside in boxes, bringing them into the house about September 15. He finds the demand for extra large blooms increasing every year.

A discussion was indulged in regarding the "chintz bug," which has been a source of much loss and annoyance to

"MOUNTAIN FLEECE" (POLYGONUM AMPLEXICAULE VAR. OXYPHYLLUM.)

chrysanthemum growers. Chas. Saunders, gardener to Prof. Sargent, stated that he had lost a great many plants from the ravages of this insect, which seems to be proof against all preventives or remedies. According to Mr. Saunders the bug is found also on gladioluses. He pierces the young flower buds on the chrysanthemum destroying them completely, or causing them to come deformed and onesided. He is brown and is exceedingly lively, being "very easy to see, but it is the very devil to touch him." Mr. Wood has named him the "Hide and go seek bug." He has found him easy to catch, however, when the plants are wet, as in a drenching shower. Mr. Findlayson says the bug does not trouble him after he has got the plants into the houses. This view was endorsed by young Mr. Dawson, who said that he had got some further relief by fumigating.

Mr. W. H. Elliott gave an account of his method of growing for the market, advocating generous applications of liquid manure and claimed that plants propagated late were the best, if grown rapidly, and would hold both flowers and foliage better. He regards careful following up the pinching process through the summer as one of the most essential points in chrysanthemum culture. Another most important point in his opinion is to find customers for your plants after you have had the pleasure of growing them. Mr. Knapp keeps his plants inside all summer, putting them right into the beds from 3-inch pots. His plan in growing blooms for the market is never to stop back the shoots, allowing them to grow any height they please, and then subduing so as to leave from four

to six buds on each. With this plan he has been most successful the past season.

Mr. Wood in answer to questions said he did not believe Mrs. Alpheus Hardy could be grown well out of doors, and that it is now impossible to distinguish between Japanese and Chinese types, owing to the crossing and recrossing which has been going on. W. J. S.

What is a Sport?

The chrysanthemum, of all our garden flowers, seems to be the one most disposed to "sport." The occurrence is always interesting, and always excites surprise. In reality, however, the change (we are now speaking of the chrysanthemum only) is not very great. In most, but not in all cases, it depends upon the non-development of a particular tint of color in a certain bud, or in the assumption in that particular bud of a tint of color different from that of the original plant.

We have examined very many chrysanthemum "sports," and have only occasionally seen any greater difference than that mentioned. But the sudden change, slight though it be, is mysterious. We know something of how it happens, but the reason why eludes us. Why are particular varieties more particularly subject to it than others? Why does the same sport occur on different plants in various places, often in different countries simultaneously? This may be due to the circumstances that all the plants of a particular variety originated from a single bud, of whose qualities they partake, and from which they have all in turn been propagated.

The chrysanthemum has been crossed and recrossed and crossed again from time immemorial by the Chinese and the Japanese, so that the existing varieties are of very mixed blood indeed. That mixed parentage has much to do with the matter, is shown not only by the circumstance that where the breed is much mixed sporting is common, but also by the converse fact that where the breed is comparatively unmixed, as in a China aster or a Chinese primrose, sporting, in the sense of bud variation (as distinct from seed variation), is very uncommon. One form of sporting may, therefore, be reasonably attributed to a dissociation or unmixing of heretofore combined elements. Assuming that this is so, we are still in the dark as to the cause of the unmixing, and equally so as to the reason for its sudden manifestation. We may compare the occurrence to a change in the position of the kaleidoscope. Turn it ever so little and the particles of glass arrange themselves in a different pattern; but what effects the turn is in the case of the sports, at present quite enigmatical. Even Mr. W. Paul in a memorable case asked "What is a sport?" he himself being, probably, about the best qualified person to give an answer to the question. Let the incident serve as an example of modesty.—*Gardeners' Chronicle*.

Mountain Fleece.

Polygonum amplexicaule var. *oxyphyllum* is its botanical name. It is a hardy herbaceous perennial and indigenous to the Himalayan Mountains, whence it was first introduced to Europe eleven years ago, and thence to America eight years ago. It is figured and described in the Botanical Magazine (Pl. 6503). Here we find it was raised from seed sent to Kew from the extreme northwest Himalaya by Dr. Aitchison, and flowered for the first time in Europe in September and October 1879. Dr. Asa Gray brought it over from Kew to America in 1881. I have grown it continuously since it was first introduced into this country, and the more I know of it the better I like it; in fact, I have not a moment's hesitation in declaring it to be the grandest hardy herbaceous perennial that we have got in bloom in October.

It is a plant of vigorous, bushy, branchy growth $2\frac{1}{2}$ to $3\frac{1}{2}$ feet high, and from towards the end of September till the end of October it bears the utmost profusion of fleecy, fragrant white flowers.

The accompanying illustration is from a photograph of a little spray taken the second week of October.

Although the plant is perfectly hardy here a sharp frost will injure its flowers, hence I would not recommend it for blooming out of doors where sharp September or early October frosts are likely to occur unless some protection such as we provide for chrysanthemums be given it, but if this is done any one anywhere can enjoy its loveliness. It is now the 30th of October and this Mountain Fleece although a good deal past its best, is still in beautiful bloom with us in the open field bordering on the south side of the orchard. I also grew and flowered a lot of it in pots this year, and without any forcing had it in full bloom the middle of September.

Of what use is it for cut flowers? For immediate use it is lovely where fleecy flowers are desirable, but I do not recommend it to keep over for two or three days, as many of the little blossoms will drop and the larger leaves wilt, I get over this latter difficulty, however, by at first

plucking off all the large leaves. And it comes in when outdoor flowers are getting scarce and before the chrysanthemums are in bloom.

It likes good ground and plenty of water particularly when grown in pots. The only insect enemy that seems to bother it is the rosebug in June, but this is enough for it almost defoliates it.

It propagates very easily from cuttings of the young wood or stems or division of the root stocks. Seeds have never been produced by any of our plants.

Glen Cove, N. Y. WM. FALCONER.

Orchids for Cut Flowers.

In Messrs. Siebrecht & Wadley's new catalogue—which deserves praise for its general merit—two orchids are classified as East Indian when they should by no means be placed in that class. The reference is to the two cymbidiums—*eburneum* and *Lowianum*. Williams, in his book on orchids, also recommends them to be grown in the East Indian house.

Though these orchids are collected in tropical latitudes, we are not told anything of the altitudes at which they are found or the conditions that produce fine plants in their native habitats. Probably but few collectors could give us satisfactory information on this subject, for they do not usually stay long enough in one locality to study all the conditions essential to vigorous growth and a free blooming quality. Even, however, if this was attainable, experience is constantly teaching us that to ensure the best results in our cultivation of many plants under glass we must vary somewhat from natural conditions. As Mr. May, in the *FLORIST* of September 15, in his remarks upon the growing of roses aptly puts it: "The conditions in the greenhouse and out in the open ground are different." So we must always remember that Nature's ways can not be implicitly followed, but must frequently be modified because of differing environment.

The attention of florists needing easily grown free flowering serviceable orchids is directed to these cymbidiums. They are so easily managed—when properly understood—and their flowers are always useful. Probably every florist who is fairly successful in his methods of cultivation can grow *Cypripedium* insigne—even though his knowledge of orchids is very limited. Go where we will we are sure to find some plants of this old favorite. And no one appears to experience any difficulty in flowering it. Why should it be so? For all know that it requires no coddling to ensure a crop of flowers. Just as simple in their requirements are these cymbidiums. They need no East Indian stove with its tropical temperature and excessive moisture. They will grow and flower with other plants in any ordinary greenhouse temperature. The soil needed is about the same as we would give *Cypripedium* insigne; a turfy loam—some broken pots or charcoal to keep it porous—and a little well rotted manure. Plenty of water, and not heavy shade, when growing; somewhat less quantity of water and plenty of light when the cool days of

autumn arrive. The stock of plants is increased in the same way as the *Cypripedium* spoken of, viz, by division.

Another orchid equally as serviceable as these—quite as easily grown—and always free in its flowering qualities, is *Zygopetalum Mackayi*. Strange to say that this, one of the easiest of all orchids to grow and flower, is seldom seen in good condition. The writer has no more trouble in growing and flowering this plant than a geranium. Mr. Keller, of Bay Ridge, also succeeds extremely well with it and has, or did have, a fine stock.

The flowers are sweet scented and are advantageous for all purposes for which an orchid can be used. It requires just about the same treatment as the cymbidiums, though a little more heat will not hurt it.

Florists who wish to grow a few orchids for the sale of the flowers can not go wrong in trying these three mentioned. Let no ignorance of orchid cultivation deter any one from this purpose. For novices are apt to be more successful with these plants than many who have been growing orchids all their lives. For the latter find it so hard to free themselves from the idea that these plants need special and particular care.

There are but few orchids that can be recommended as profitable for growing for cut flowers. It is very easy to be led away by highly colored descriptions, or even by the appearance of many beautiful orchid flowers into purchasing plants that never can prove remunerative. All orchids that are difficult to grow, or to flower, or that need high temperatures, are unprofitable to the florist who needs them for to make use of the flowers. But it is a pleasure to recommend to all these here mentioned, as it is certain that success is easily attained, and that the flowers are desirable in every way.

It is to be hoped that those authorities who class these orchids with the East Indian, will revise their classification and not thereby mislead the ignorant.

A. E. WHITTLE.

Cheap Ventilating Apparatus.

Whenever the first investment can be afforded the patent ventilating apparatus advertised by several manufacturers will undoubtedly prove the best in the end, but where this can not be afforded a very fair substitute may be put in at slight expense on the plan shown in the accompanying illustration.

The sketch shows the apparatus in a greenhouse belonging to Mr. J. T. Anthony, a Chicago florist, who has combined all the best points from similar ones in use by other florists in and around the city.

The ventilator rods are stiff, one end being bent over through which they are screwed to the sash; the other end is provided with an eye. In putting up, the wire clothesline cable is first carried the length of the house, run through the last pulley and attached to the eye in the last rod, which is lifted by the main cable direct. The cable is then attached to the double blocks at the other end of the house (see sketch) and drawn taut. All the remaining sash are then attached to the main cable by shorter pieces of the same in the manner shown in the sketch, the splice with the main cable being made first, then carried through the pulley screwed to the roof and last tied through the eye of the ventilator rod. Having the slack end of the piece to tie with the length of each one can be adjusted to a nicety, and if any do not afterward open evenly the piece can be easily

shortened or lengthened to suit. In the double blocks through which the lifting power is applied stout braided window cord is used, the free end of which is secured with a few turns over the bitts below when it is desired to hold the sash open. The first block should be secured so that it always stands in an upright position as otherwise the cord will bind on the block when power is applied.

Mr. Anthony states that the cost of fitting a house of ten ventilators with this apparatus is about \$4.50 and that two men can put it up in about an hour's time. The ventilator rods cost him 25 cents each, made to order by a blacksmith, cable 60 cents for a house, 10 awning pulleys 3 cents each, and the double iron blocks 70 cents. This makes a total of \$4.10, leaving the balance to cover cost of cord and screws.

Proper ventilation is a very important matter which is frequently slighted where each sash has to be opened separately, owing to the amount of labor involved, and we have always believed that even expensive ventilating machinery paid for itself in a short time through securing for the plants better ventilation on account of the ease with which it was given. And while many may feel that they can not spare the money necessary to put in the regular apparatus they will find the substitute described so cheap and so effective that they can not possibly afford to be without it.

Nomenclature.

It is now nearly eighteen months since the "Nomenclature Committee" was appointed by President Hill at the New York convention. This committee was called into being in answer to a spontaneous enthusiasm aroused by Mr. Halliday's essay on "Nomenclature."

This essay appeared to touch a spring which aroused all florists' minds alike, for some of the abuses there spoken of had been the general experience. There is probably not one florist who at some time or other has not been deceived as to the character of the plant or plants he has purchased. Therefore, when Mr. Halliday denounced as fraudulent the practice of selling one variety under two or more different names—obviously with the intention to deceive—all echoed the denunciation, and believed that by the appointment of a committee much effective work could be done.

After these months it is pertinent to inquire as to the good accomplished by the committee. Whether there is a field in which such a body can work—if so, what particular work is calculated to be of the greatest advantage? Any remarks by the writer in this direction will not, it is hoped, be considered as critical; for, as he served with this committee, any comment applies equally to one as to the other. The purpose is to speak from personal consideration, hoping that others will do the same, thus enabling progress to be made. No advancement is ever effected without many failures, and this work of revision of nomenclature is not likely to be any exception to the rule; and it is always one sign of progress when the eyes are not closed to failure, but the weakness seen and amended.

Mr. Peter Henderson declared in the writer's hearing at Buffalo that such a committee could not possibly effect any appreciable result. To ascertain whether this is so is within our province to determine. Effort that is useless is worse than wasted. There is so much to be done that concentration upon work that

is likely to be effective should be the only aim.

That there is need for an improvement in our nomenclature all must surely allow, and no better illustration could be had of this need than the general expression of the fact at the convention in New York. Very often there is a want felt and yet a very superficial view is taken of this want. Though the expression of approval with the sentiment of Mr. Halliday's essay was so unanimous and the expectation so universal that a committee would be able to work at the root of the evil; yet the measure recommended by the essayist in the appointment of this committee, and endorsed by public opinion does not appear likely to produce any marked result in the attempt to correct our nomenclature. We could all acknowledge the want when our attention was directed to it; but we did not, and perhaps do not yet, give the subject of this want sufficient thought in order to apply the right remedy. In all human affairs no great want is supplied without profound consideration, and in this our need we appear to be as far as ever from making any change calculated to be of general benefit.

To the question then whether any good has been accomplished by this committee one of the members must acknowledge that he can see but little. In the first place members of this committee are not able to detect the false nomenclature from the true, other than by actual experiment or from past business experience. To make a thorough search for all falsely named plants would entail much labor, time and expense. Where is the man that can afford these?

In the second place there is much of this false nomenclature as we are all so ready to assume? Are there so many plants that are renamed in order to deceive purchasers, solely for the pecuniary benefit of the individual so doing? Sometimes this may occur through ignorance, if so, are there many such cases to be met with? A limited observation can not assert that there are. The few authenticated instances are generally known, and florists do not need any special committee to call their attention to the facts.

Though it may be deduced from these few remarks that this special committee has not accomplished much, yet it would be an error to assume that there is no field for labor, no work for some properly constituted authority to perform. We florists require some standard that will settle decisively for us, all these vexed questions of nomenclature. And there is more of interest to us involved in the subject than appears on the surface. We need not only to correct names, but we also require aid in estimating the comparative value of the numberless new varieties of florists' flowers that flood the country. There should be some standard of value to which all might look up.

It is very easy to raise new varieties, but it is extremely hard to raise improved varieties. Is it absolutely necessary that each year should find us burdened with new plants decidedly inferior to those already in commerce. Let the growers who deal in these varieties protest earnestly that this must be—that there is no remedy—that the man who imports is not bound to provide with his capital an experience for others, yet in the opinion of many this is not to the advantage of the trade in general—that there may be a way to enlighten the ignorant without injuring the individual.

In the literary world there is not much

chance of a book finding many purchasers if it is without merit in its particular class. No sooner is a book published than it receives criticism, favorable or otherwise, from competent men. They influence public opinion, and according to their verdict usually is the sale of the book. Florists, however, are at the dealer's mercy. They have nothing to go by except his description, which is generally made to fit the occasion. As a rule no man will trust another in a horse trade, if he does he is almost sure to be sold as well as the horse; and it would seem as if the same principle, or want of principle, applies to most of our transactions with one another in regard to new plants. The ethics of our business demand broader views.

If there is really no remedy we must go on in the old way. Either wait until

CHEAP VENTILATING APPARATUS.

the plant is proven a success by the experience of others, or buy according to the raisers' or growers' description. Even when we wait uncertainty as to the merits of any particular variety is generally experienced, and it is only by actual experiment that a fair test of its value can be determined. The suggestion is that there is work here for the S. A. F. Many committees are appointed each year for various purposes, all expected to serve for love—suppose we change this and appoint a committee to serve for adequate recompense.

The many valuable suggestions and plans that have been offered for the establishment of an experimental garden all point to a combination of such a garden with a school of horticulture. This without outside aid is an impossibility to the society. Even an experimental garden alone could not be conducted without considerable additions to our finances. But why could not a portion of the experimental plan—the ascertaining of the comparative merits of new varieties—be assigned to competent men of our society? Let one man obtain and grow all the new roses of the year and report to the society. To another be given the carnations, another the chrysanthemums, etc. Why should this be considered beyond our means? Why could not such a plan be made to prove of incalculable benefit to us all? By these means if duplicates are offered we should all be aware of them before any person could be victimized; and not only so, but if all new plants were to receive the endorsement of the society, founded upon the recommendation of competent, qualified authority, great care would be exercised by all to offer only that which is really meritorious.

Would society suffer? Certainly not. Trade in new plants would increase, and the holder of any good thing would

receive double recompense. Naturally this would be so. People are afraid to buy new plants. Not because of the price, but because to do so is often completely to throw money away. Descriptions in catalogues are quite worthless. They are like an editor's opinion of his political candidate. Colored by the desire for personal gain.

The class of flowers here considered is more particularly that commonly designated as florists' flowers. The class specially instanced by Mr. Halliday—that to which so many commercial florists devote their attention. There is, however, work a'so to be done in "scientific nomenclature." The writer here wishes for information. Who is the competent authority in this country to determine the genus to which any particular plants belong? The answer will probably be—"The botanists." But is not this very vague? Should we not have some known authority to which we could all appeal? Who made Prof. Reichenbach the authority? If I find a plant unknown to commerce, to whom shall I send it to determine its species and genus, and whose decision will be final as to its ultimate place in our catalogues? Surely if we have a national society an authority established by this society should be the standard to which we all could appeal. Who is responsible for the very inappropriate names of some of the genera? For instance, what authority gave the beautiful (?) name *scabiosa*—from the Latin word meaning the itch? Suppose a number of us would like to change this name, to whom shall we apply? Can not the society help us in this matter of "scientific nomenclature?" Appoint its authority and sustain this authority.

To summarize. Let a committee upon the nomenclature and merits of new and other plants be established by the authority of the society; subdivide the work among the members of this committee; let them be paid for their labor, for it is certain that no work will be thoroughly done unless the worker receives a suitable return for his labor. If the society calls upon its members for an outlay of time and money it should be ready to return a recompense. There need be no great difficulty in obtaining sufficient funds for this and other purposes. Many objections were raised to the increase of the annual dues. Members of the Executive Committee supposed that some would be frightened away from the society thereby, but experience proves the contrary, and there need be no doubt that so long as the society continues to perform helpful work all necessary funds will be forthcoming.

ALFRED E. WHITTLE.

CANNA "VIRGINIA DARE" is the name of a new variety raised by M. R. Catlin, Richmond, Va., and of which Mr. C. has sent me flowers. It is the finest thing in the way of a canna that I have ever seen. The spike is stiff and closely furnished with splendid glowing orange scarlet flowers slightly edged with yellow, and yellow in the throat. The petals are over an inch wide and the individual open flowers nearly four inches across. The habit is dwarf and the foliage deep green. Mr. C. gives me its history: It is a seedling raised by him from seed sown in February, '88, it bloomed the June following. As soon as its merits were observed his whole energy was exercised in increasing the stock, and in September, '89 he had a hundred plants. All through last winter it bloomed beautifully in pots in the

greenhouse, and it bears better flowers indoors than outside, it is for its value as a winter blooming plant that he most appreciates it.

No class of plants require more careful cultivation than roses that are grown under glass. All successful growers of roses can corroborate this statement from their own experience; for no matter how able the grower is, he can never be certain that all his roses will be of an equal degree of excellence—and they never are. In one house the *Perles*, etc., may look magnificent; in another, the same variety, grown, as far as he knows, under exactly the same treatment, may be of decidedly inferior quality—why this is so is not always apparent. What other class is so susceptible to changing conditions as this? We succeed fairly well one year, and the next in spite of all our care and forethought some untoward condition, for which we are not prepared, will arise and our roses suffer in consequence.

This fall the atmospheric and other conditions seem more perplexing than ever. So much wet weather; so little sunlight; such an excessively humid atmosphere; all have had their effect in compelling continual vigilance. The conviction is intensified that it is impossible to teach a man to be a rose grower. Not a day but what some caution to workmen is needed. Spider, aphids, mildew to be watched for and checked at their first appearance. At some periods frequent waterings; at others days must pass without any being given. Temperature at night sometimes to be varied according to the weather. Ventilation needing hourly watchfulness. Every care must be exercised if a high grade of roses is to be the production. Then, after all, black spot or some other insidious disease which we know not how to control, will ruin all our calculations.

Some men, who do not know, think it an easy matter to grow roses. Orchid growing appears to them the hard nut to crack. But a set of rules can be applied to orchid growing with much more safety than to rose growing. The requirements of orchids are not so complex, and their welfare is not so quickly influenced by apparently trifling changes.

No essential of rose growing needs greater care than the watering. It, more than anything else, makes or mars the rose. Even here no rule can be given, for each variety of rose requires its own treatment. Soil, temperature, the water required, is governed entirely by the individuality of each rose we grow. Water a *Papa Gontier* as profusely as some others and good-bye to any success with it for some time. Much dissatisfaction has been expressed with this rose for shedding its leaves. This weakness can always be controlled by the grower. When this is noticed, at once cease watering. Do not water again until the soil becomes dust dry, and the roses show slight signs of wilting; then water so that the bed becomes thoroughly soaked. Always, however, continue to be careful

that no water is given unless the bed is dry; then water freely.

Niphetos is another rose that is easily affected by an over supply of water. But this variety shows the injury in the quality of the flowers. The petals become twisted, and more or less green appears in them.

No rose is more easily affected by the least change in the atmosphere, temperature or watering, than the variety *Mme. de Watteville*. Last year with us it was a complete failure. This year somewhat of a success. A most profuse bloomer, but needing some disbudbing to ensure the largest flowers. Can generally be cut with long stems. When well done more desirable than *Mme. Cusin*. But let no mildew obtain a lodgement on the leaves. Spider and aphids are its deadly enemies. A dry condition of the soil is to be avoided. A rose occupying its own place—commendable for its beautiful tints—but not a rose that can ever be grown well in a hap-hazard fashion.

ALFRED E. WHITTELE.

Soils.

This being the time of year when one of the most important materials for growing plants must be secured, a few remarks on the subject may not come amiss.

I find that many florists in the west labor to great disadvantage in regard to soil, especially if they happen to be in an alkali belt. Almost the first question you hear from them is: "Did you ever see plants get burned on the edge of leaves and then die?"

I have had some experience in that direction myself. First when in Missouri I struck a soil in which I potted a lot of verbenas and other soft wooded plants and they stood in the pots over two months and never made a leaf. Also had put same kind of soil on a bench in greenhouse, but the plants would not grow. I examined the soil and found there was not a particle of lime in it, so I made a strong lime water and applied it to some of the plants, both in pots and on the bench. All that were thus treated started to grow at once, but those that did not get lime never did start. I experimented with the same results frequently.

The year following I was in a part of Kansas noted for gypsum and alkali, in fact in some places the alkali was so strong that plants would not grow in it. I also found that where this was the case there was no decomposition of vegetable matter. In places where stable manure had been used three years before the straw and leaves were still intact. Now where there never has been decomposition of vegetable matter there is no ammonia, and as that is one of the most essential of all plant foods, it must be supplied. The way I did this was to neutralize the alkali by applying an acid to the soil. Have used refuse hops, apples—after coming from cider mills, diluted vinegar, or any fruit containing acid, all with the same results.

In some parts of Colorado the alkali is so strong that fence posts of pine only three inches in diameter that were put in ten years ago are still solid, yet some were in water most of the time. I also find that scarcely anything grows there. Sometimes the soil is full of alkali and the persons using it do not know it. Roses when planted in soil of this kind seem to start off all right for a time, but soon a few of them get light colored leaves and in a few days the edges turn down and look as if they had been scorched or burned, then it is only a

matter of time until the plant dies. It always takes the weakest plants first and some varieties of roses are more subject to it than others; *Perle des Jardins* is usually the first to succumb, and in some parts of the west the florists call it "Perle rust," but if the soil were analyzed it would be found that alkali is the cause of the rust.

It not only affects plants under glass, but also vegetables grown outside. One gardener near Denver lost his crop of celery from the same cause. The following year he applied acid to the soil and raised a good crop on the same ground that failed before. One cause for so much alkali here is from the water used for irrigating. It comes from the mountains and carries with it the fine particles of rock and sand from the quartz mills, which are located along nearly all mountain streams. The sediment contains alkali in great quantities, in some places the sides of the ditches are all white and look as if they had been whitewashed. Where much water is used the soil in the gardens also gets a coat of white, frequently one sees a patch in the center of a field where no sprig of vegetation will grow, but apply acid in any form and see how quickly a luxuriant crop of vegetation will come.

Denver, Colo.

Useful Summer Blooming Flowers.

BY A. E. WHITTELE, ALBANY, N. Y.

[Read before the Society of American Florists at Buffalo, August 22, 1899.]

It is not the object of the writer of this paper to attempt to specify and describe all the flowers that can be made available for useful work during the summer. Many plants that bear handsome flowers during this period are valuable only for decorative purposes in the flower garden. His design is rather to select examples, and call the attention of those florists who grow for the cut flower market to those plants whose blooms are always of value as cut flowers; and this enumeration will be principally of flowers that can be grown outside during the summer months. Seldom do we find a florist who is systematic in the growing of summer plants, in order to have a constant supply of useful flowers. His efforts in this direction may be characterized as rather aimless, for though he may have plenty of flowers outside, they are often of a kind that are useless for what is required; and still more frequently they can be found in his gardens in quantities, only at irregular intervals. True, the most serviceable of these flowers at this season are of little value in a financial point of view; but florists require flowers in summer as well as in winter, and it is to their interest to possess those that are the most advantageous to them.

As a rule there is a dearth of useful flowers in early summer. It is too soon to look for flowers outside from spring-sown seeds, and spring-planted plants, and too late to gather very much from the greenhouses. Roses at this period often command as high prices as during some of the winter months, as florists now commence to prepare for the replanting of their rose beds and the crop of these flowers is diminished thereby and the supply decreases through the summer months. Carnations also at this season are not so plentiful as earlier in the year. It is therefore necessary to fill up the gap in the best way possible by preparing ahead for a supply of useful flowers.

Catalogues teem with the names of plants recommended for summer blooming and that are really desirable for many

purposes; but of this number only comparatively few are of advantage to the florist. Summer flowers, equally with those of winter, to be used in florist's work, must have long stems and good keeping qualities. A list has therefore been carefully prepared of the flowers which bloom in the summer, and which can be recommended for the purpose under discussion, rigidly excluding those for which a florist has no place. The title, therefore, of this essay, as printed is somewhat of a misnomer.

The design in preparing this list is to specify the plants that are considered desirable to be grown for each month in summer, commencing with May and ending with October. Before proceeding with this list it is but right to say that able assistance has been given to the writer by Mr. Falconer, of Glen Cove, L. I. A few simple cultural directions will be given where it is considered desirable.

PLANTS TO BLOOM IN MAY.

Greenhouse: gloxinias, lapagerias, stephanotis, roses, carnations, heliotrope. Gloxinias to be had in flower for this month should be potted early, not later than March, and kept warm.

Stephanotis may be had in flower in April if placed in a temperature not less than 60 degrees through the winter.

Lapagerias will continue blooming until fall, the white one being very desirable. Stephanotis will last through June and July.

Frames: pansies, myosotis, anemones, mignonette, candytuft, calendulas, stocks. Pansies may be had in bloom in April by sowing the seed early in the preceding fall, not later than the end of August. There can be no flower more useful to the florist at this time of the year than mignonette and candytuft. These may be had either by sowing seed in the fall, providing the protection of a cold frame through the winter, or by sowing in moderate hot bed in early spring. Seed of the intermediate stock should be sown in early fall, ten-week stock in hotbed or greenhouse in March.

Shrubs: Magnolias—stellata, conspicua, Soulangiana; lilacs, Viburnum opulus, Deutzia gracilis, Spiraea Van Houttei—cautoniensis; tree peonies.

Herbaceous Plants: Trillium grandiflorum, early peonies, lily of the valley, Hesperis matronalis, Iberis sempervirens, Dielytra spectabilis.

Attention is directed to the perennial candytuft. It is excellent for all purposes as cut flowers.

PLANTS TO BLOOM IN JUNE.

Greenhouse: Allamanda Schottii, lapageria, stephanotis.

Shrubs: Chionanthus Virginica, Philadelphus grandiflorus, Deutzia crenata fl. pl., roses.

Hardy and herbaceous perennials: Paeonies, German irises, Coreopsis lanceolata, double pyrethrus, Lilium tenuifolium—Hansonii, candidum and longiflorum; Spiraea palmata, Cypripedium spectabile, Hemerocallis flava, Delphiniums.

Coreopsis lanceolata is very showy and quite desirable. Seed should be sown in July and plants will bloom in the following spring. Lilium candidum and longiflorum may be had in flower both through May and June by retarding bulbs potted in late fall.

Annuals: Coreopsis coronata, mignonette, candytuft, alyssum, sweet peas, Helianthus cucumerifolius, asters, stocks, dianthus in variety, double feverfew, Gaillardia picta, Lorenziana and hybrids, scabiosa.

Among the most satisfactory annuals for summer work must be named the gaillardias. They are extremely showy and generally sell readily. To have them in flower in June, seed should be sown in February. Mr. Denys Zirngiebel, of Needham, Mass., in answer to a question, kindly gives some information concerning the early blooming of asters. The seed is sown in December, plants when up are potted into 2-inch and then 3-inch pots, and then planted outside in April, where, if they are properly hardened, they will endure some degrees of frost. By this method Mr. Zirngiebel places asters in the market by the middle of June. Of the various forms of asters, not one is superior for florist's purposes to the Victoria strain. The flowers are very handsome, of fine form, and produced in great abundance. A variety called Burpee's Dwarf Queen, seen growing at Glen Cove, L. I., can also be highly recommended.

There is no reason why asters may not be had in flower from June until October. All that is needed is successive sowings of seed from December until the first or second week in June. Of course the two later sowings may be drilled outside. A very fine bed of asters is now coming into bloom (August 10) from seed drilled outside the first week in May. Another sowing in June will enable flowers to be cut until frost. It is perhaps superfluous to mention to practical men that strict attention must be given to the proper thinning out of seedlings that grow from outside drilled seed. The writer has no experience in experimenting with asters as an inside crop. That this is feasible is very probable. Perhaps some gentleman now present may be able to speak upon this point. Stress is laid upon the value of asters as cut flowers. They are essential to every florist, and the longer the blooming season can be prolonged the better for florists in general.

Candytuft is another annual that can be had at any time in spring, summer and fall. All that is necessary is successive sowings. The dates of these sowings should be decided by each individual for himself. Localities differ, and what may be the right time for one may very likely be the wrong time for another. The aim is to direct attention to the possibilities of a continuous supply of the flowers of desirable annuals. Mr. Zirngiebel states that when candytuft is transplanted the plants flower sooner than when the seed is drilled and the seedlings, after thinning out, allowed to remain.

PLANTS TO BLOOM IN JULY.

Hollyhocks, gladioluses, Hyacinthus candicans, Montbretia crocosmæflora, Milla biflora.

Gladiolus, as is well known, may be had in flower much earlier in the season. The montbretia and the milla are both desirable.

Old clumps of hollyhocks flower earlier than plants from fall sown seed. A succession of these flowers may be had by having some old clumps and planting every year, plants raised from seed sown in October.

Perennials: Lilium candidum, longiflorum, auratum, superbum; Iris Kæmpferi, Phlox decussata—varieties, Spiraea Ulmaria, fl. pl., Asclepias tuberosa, Helianthus multiflorus, fl. pl., Euphorbia corollata; Yucca filamentosa, Lathyrus latifolius.

PLANTS TO BLOOM IN AUGUST.

Shrubs: Hydrangea paniculata grandiflora, Tamarix chinensis.

Miscellaneous: Cannas, dahlias, glad-

ioluses, montbretias, feverfew double white, Solanum jasminoides—the latter in greenhouse.

Some florists have made quite a success in growing the white dwarf dahlia—camelliaflora—as a fall crop in the greenhouses. It is very prolific, and most useful for our work. If managed so as to have the plants in full flower during the month of October, they become quite valuable, for frosts during this month kill all tender outside flowers.

Perennials: Liliums in variety, Phlox paniculata varieties, Euphorbia corollata, Anemone japonica, Funkia grandiflora.

Annuals: Second crop of asters, candytuft, etc.

PLANTS TO BLOOM IN SEPTEMBER.

Miscellaneous: Tuberoses, feverfew, second crop; dahlias, carnations, cannas, bouvardias in greenhouse.

It is always well to grow a sufficient number of carnations, in order that a few may be allowed to bloom early. These need not be planted inside for winter work, but kept solely for the fall flowers.

Hardy perennials: Helianthus multiflorus, fl. pl., Anemone japonica, Pyrethrum uliginosum, Lilium speciosum, Eupatorium ageratoides, Eulalia japonica. Mr. Falconer states that the eupatorium, though wild, is worthy of notice and cultivation.

PLANTS TO BLOOM IN OCTOBER.

Annuals: Asters, alyssum, Calendula Meteor and P. of Orange, verbenas, seudouble geranium, candytuft.

These flowers will bear a few degrees of frost.

Feverfew, double white, pansies from seed sown in July.

Perennials: Anemone japonica, Pyrethrum uliginosum, early chrysanthemums, Helianthus Maximiliani, Eulalia japonica.

Flowers in Parks.

At the Buffalo convention Mr. McMillan, superintendent of the Buffalo parks, read a rather comical and ironical essay on the planting of flowers in parks, especially the planting of Mosaic beds, ribbon lines and the planting of flowers in the shapes of animals, etc.

There is no doubt that the planting in geometrical style may be out of place in some situations but in others highly desirable. We do not think florists should encourage planting ludicrous designs that are likely to create disgust in the people's minds against flowers. But we think as florists the planting of flowers judiciously in parks should secure every encouragement, for the park is a place where people are taught to love nature, and what is more beautiful and desirable in nature than flowers?

We think and have heard prominent florists say that they thought the Buffalo parks would be much improved if more flowers were introduced. While the Buffalo parks may do very well from a landscaper's point of view there was very little to interest a florist, or a lover of flowers.

To show the difference from a florist's point of view I would say that I would like to visit Chicago every year just to see Lincoln and South Parks and am sure that I would never visit Chicago in the summer without visiting both parks, but with due respect to Mr. McMillan, would not pay five cents car fare to see the Buffalo parks unless they learn there to plant flowers more extensively.

HERBERT G. WALKER.

Louisville, Ky.

Orders for less than one-half inch space not accepted.
*Advertisements for December 1 issue must REACH US by noon, Nov. 25. Address

THE AMERICAN FLORIST CO., Chicago.

HERBACEOUS PLANTS.—"We are very busy, and shipping a great many herbaceous plants. The demand for these plants is growing rapidly. When we began growing them as a specialty—about six years ago—it looked like a hopeless task to make hardy plants a paying business. We now have customers from Nova Scotia to Texas." This is what one of the largest firms, dealing in this class of plants, in the country writes us. Now, there are a million families in this country to-day who want this sort of stock and it depends upon you to supply them.

Most of these people don't know what they want, don't know, in fact, that they want anything, so you have got to tell them that they want it, explain to them why they want it, show them what they want, and then let them have it—good plants of the hardiest, thriftiest, most showy and desirable stock, and at reasonable prices.

MR. TUNIS DE PEW, a well known florist of Nyack, N. Y., is a man who says what he means and means what he says. Some time since his fellow townsmen wanted him to run for the office of Mayor of the village. He declined; they insisted, and he posted up a notice in the poll room that he was not a candidate, and if elected he would not serve. He was elected, but as he would not go back on his word he refused to serve and another election had to be held.

NEW WHITE CARNATION.—John McGowan, Orange, N. J., sends us a half dozen blooms of his seedling white carnation and they are certainly excellent. They are large, full, very white, with perfect calyx, on long stems and fragrant. Mr. McGowan states that the plant is a vigorous grower and very free bloomer.

DECEMBER 1 is the latest date at which you can get an adv. in the new trade directory which we are now preparing. Attend to the matter at once.

IN THE issue of *Garden and Forest* for November 6 appears an admirable half-tone plate of the beautiful fern *Gymnogramme schizophylla*.

Catalogues Received.

P. J. Berckmans, Augusta, Ga., plants and nursery stock; Reasoner Bros., Manatee, Fla., plants; Fraser & Lippincott, Huittsville, Ala., nursery stock; Hillebrand & Bredemeier, Pällanza, Italy, seeds and bulbs; E. Verdier, Paris, France, new roses; W. A. T. Strat'an, Petaluma, Cal., plants, seeds and bulbs; W. Allee Burpee & Co., Philadelphia, seed novelties; Gaines, Coles & Co., State Line, Miss., nursery stock; Harlan P. Kelsey, Highlands, N. C., nursery stock; E. M. Mitchell, Port Hope, Ont., plants; A. B. Strickland, Union Springs, Ala., plants and shrubs.

New Notes.

UTICA, N. Y.—J. Howells has built one new greenhouse 15x60.

MILWAUKEE.—Capar Thoman has leased his establishment to John Rost.

FORT DODGE, IOWA.—John M. Kellenberger has just completed two new houses 12x60 each.

ERIE, PA.—Miss Lena, daughter of W. Niemeyer, the florist, was married recently to Mr. Edward Auffinger, of this city.

CLEVELAND.—James Radie has just added to his nursery in Glenville four new rose houses each 104 feet long, heated by steam.

SUMMIT, N. J.—The New Jersey Social Florists' Club entertained a number of visitors on the occasion of their opening of reading room and bowling alley in their new building at Mr. J. N. May's nursery, November 14.

OREGON CITY, OREGON.—The Oregon City Nursery Co., Clack and Collins proprietors, have started into business here and have built two rose houses 16x75 each, one carnation house 10x75, one violet house 18x75, and a propagating house 10x75.

MONTREAL.—At a recent funeral here Florist Jas. McKenna lined the inside of the grave with autumn leaves placed so close together as to completely hide the soil. The mound of soil thrown out from the grave was covered with the crimson leaves of the sumach with some of the cones intermixed.

KALAMAZOO, MICH.—Geo. Taylor has built two new greenhouses 100 x 18 each, the finest in the city, the Mountain Home has added two small ones and E. F. Forbes one more. Jos. Dunkley's roses and carnations received first premium at the Detroit and Kalamazoo fair. Trade is very good at present. A heavy frost about October 1 killed everything outside and hurt celery.

DAYTON, O.—The florist business of Mrs. J. E. Heath who died August 1, will be continued by R. H. Heath. W. G. Matthews has been very ill with typhoid fever but is now recovering. H. H. Ritter has just completed a fine new carnation house 25 x 125 for growing the new fancy carnations. John Bochner and W. G. Matthews have each arranged to heat with natural gas.

NEW BEDFORD, MASS.—Florist F. Pasell gave on the 6th to the 9th insts. one of the finest exhibitions of chrysanthemums ever seen in this city. There were 600 plants, all grown to single stems and in the finest possible condition. A table of fifty grafted plants with from four to six varieties on each plant was a decided feature. Half of the proceeds of the show went to the Young Men's Christian Association.

MILWAUKEE.—The Wisconsin Florists' and Gardeners' Club elected officers as follows at the annual meeting held Nov. 6: President, C. W. Ringrose; Vice-President, Archie Middlemas; Secretary, J. M. Crowley; Treasurer, C. B. Whitnall; Trustees, M. P. Dilger, B. Gregory and Wm. E. Eilsen. It was decided to appoint a committee of three members to confer with the State Agricultural Society in reference to the selection of representative florists and gardeners on the list of judges of horticultural displays at state fairs in the future.

Boston.

Mr. C. M. Atkinson exhibited at Horticultural Hall on October 26 a finely bloomed plant of *Dischyanthus grandiflorus*.

Mr. David Smith long established and well-known as a manufacturer of hot water boilers, etc., has disposed of his establishment to one of his employees.

Mr. Frank Becker has recently returned from Europe. He gives an interesting account of the terrible destruction done by the early frost in the nurseries and gardens of Belgium.

An auction sale of imported shrubs, etc., was held on November 2 by Mr. Hatch for Mr. Joosten of New York. The quality of the goods was unusually good and prices averaged very well.

The residence of Jackson Dawson at Jamaica Plain narrowly escaped total destruction by fire recently. As it was, Mr. Dawson lost a number of highly prized horticultural works and other articles of value and interest. The cause of the fire is a mystery.

The mild weather with its attendant influx of chrysanthemums has made life a burden to the rose growers for the past fortnight, and the effect on the flower trade in general has been most unfavorable. The street fairs are on all sides, staggering under loads of chrysanthemums, roses and carnations. Violets sell well, however, and do not seem to suffer much from the situation. A few *Primula obconica* and cyclamens are beginning to come in.

At the November meeting of the Gardeners' and Florists' Club, Mr. E. A. Wood exhibited for the first time the following seedling chrysanthemums: J. H. Freeland, a very handsome flower, creamy white suffused with pink, the center petals standing erect, making a large, deep flower; Mrs. E. W. Wood, a full double flower of a deep magenta shade with a peculiar unevenness of the petals resembling crumpled paper; and an unnamed variety, a small reflexed flower having ten or twelve rows of the purest white petals, making a very deep bloom.

W. J. S.

OBITUARY.

ANDREW EADIE, son of the late James Eadie, of Cleveland, died at his home in Glenville, October 23, aged 35 years.

He was born in Scotland, but was brought to this country by his parents when a child of 2 years. He has been engaged in the florist business all his life, acting as foreman for his father for the last ten years owing to the latter's poor health. He leaves a widow and three small children.

Andrew Eadie was one of the most popular young men in the trade in Cleveland. He was progressive in his ideas and a most genial companion when it was always a pleasure to meet, and a large circle of warm friends will mourn his untimely death.

VARIEGATED MUSA ENSETTE.—In reply to Messrs. G. R. Clark & Co. I would say that I have plants of *Musa ensete* which are distinctly variegated. The plants are strong. I raised them from young sprouts.

Kalamazoo, Mich. FRANK GOEIKE.

WHEN SENDING us copies of papers do not fail to distinctly mark the item you wish us to see. We receive so many that we can not spare the time to hunt up items unless plainly marked.

Re Seed Trade.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. McCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1890.

IT IS SAID THAT Messrs. Burpee & Co. will reduce their catalogue to the amount of one cent in postage.

MESSRS. PETER HENDERSON & Co. have already printed some departments of their 1890 catalogue.

MESSRS. HALLOCK, HENDERSON, BURPEE and CHILDS are said to control entire stock of the new Ruby and Gold Watermelon.

VISITED CHICAGO: Mr. Thos. Griswold, Mr. Chas. Woodill, of Thorburn & Co., Mr. O'Neill, of D. Landreth & Sons, Mr. Wm. Henry Maule.

HENRY A. HANNA for 12 years connected with D. Landreth & Son as traveler, and located in St. Louis, died last week at his residence in that city, aged 48 years.

THE CANAJOHARIE *Courier* of Sept. 3, 1889, gives some interesting details concerning the financial management of the A. C. Nellis Seed Co. by its former president, Mr. A. C. Nellis.

FARMERS in the pea districts of Northern New York are organizing with a view to dealing direct with the seedsmen, and thus escape the profit now received by the contracting middleman.

AN ADVERTISEMENT in the new trade directory we are now compiling will be a standing adv. for at least two years. Order and copy must be received by December 1 at latest. Rates sent on application.

J. A. EVERITT & Co., seedsmen, of Indianapolis, have sold their monthly paper, the *Agricultural Epitomist*, to The Epitomist Publishing Co., Hoss & Palmer, proprietors, and will hereafter manage their seed business as a separate concern.

SEND IN your order now for a copy of the new directory, price \$2. It will be ready January 1 next and will be a great advance on the old one. We have spared no expense or labor to make the list perfect, and from the enormous number of changes made from reliable information we believe it to be as near correct as it is possible to get it.

AKRON, O.—Bert T. Wills is reported to have burned out. No particulars.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (ten words) each insertion. Cash must accompany order. Plant advts. not admitted under this head.

THE
American Florist Company
will publish a **CORRECTED EDITION** of the

DIRECTORY
OF
Florists, Nurserymen and Seedsmen

FOR 1890

About January 1, next.

A large number of new names will be added, changes and corrections made, bringing the Directory up to date and we believe much nearer perfection than the old list. We have been collecting the material ever since our last edition was published, and the largest proportion of the changes and additions will be made from the printed cards, letter heads, etc., of those in the trade received since early in 1887. Corrections from such data can be relied upon as being absolutely correct, and the great value of a correct and complete list to the trade can not be over estimated.

The permanent value of a **STRICTLY TRADE** advertisement in a book of this kind is recognized by all. Send in your advertisements at as early a date as possible.

ADVERTISING RATES SENT ON APPLICATION.

Every advertiser is entitled to a copy of the Directory.

Subscriptions for the revised Directory at \$2.00 a copy are solicited.

NEW DIRECTORY.

THE AMERICAN FLORIST CO. WILL PUBLISH A NEW EDITION OF THEIR WELL KNOWN TRADE DIRECTORY OF THE UNITED STATES AND CANADA,

and propose to issue the same in time for spring trade of 1890. All persons in the trade who know of any changes from former Directory, either because of errors in that or of new places, are requested to send us the same.

We propose, where possible, to state amount of glass owned by each firm; and all who report to us are urged to state amount they have in round numbers that we may insert the same in the Directory.

ADDRESS

AMERICAN FLORIST COMPANY,

54 La Salle Street, CHICAGO.

A Recent Dialogue.

FLORIST—Here's some of those new roses. They're just like all the other great novelties. They don't grow at all and the blooms are nubbins.

VISITOR—Yes they do look poor, but none of your roses seem to look any better. These Bon Silenes look fully as tough and if you can't grow Bons how can you expect to grow others? Besides, that soil is miserable stuff, and is as dry as dust in spots, and guess you haven't been through this walk lately for the spider's webs are thick, and it seems as though all the water had been thrown into the walks instead of on the benches. I don't blame you for keeping out of here as much as possible for it is awful punishment to wade through such mud. No wonder your roses are diseased. Why, just look at the greenfly, there's a million if there is one! And say! If that isn't the toughest—

FLORIST—Get right out of here!

[There was no mistaking the tone of this last, and the visitor "got."]

PRIMULAS.

Strong plants of P. Obconica for winter flowering, in light cases, by express. \$5.00 per 100. Fresh Crop (1889) Seed of "Obconica" \$1.00 per 1000 seeds.

Chinese Sacred Lily.

The fact that great anxiety existed in the minds of people to learn the origin of the Chinese sacred lily induced us to procure at great expense, the services of two antiquarians and three linguists, whose labors after close study and careful research for a period of one hundred days and two hundred nights, have been rewarded by the elucidation of the following graphic and concise history:

TRUE TRANSLATION OF THE CHINESE LABEL ON THE BASKETS, GIVING THE HISTORY OF THE SACRED LILY.

On the 4th of July, 1576, Ili Kin Foo, great and immortal Emperor of all the Chinas and brother-in-law to the moon, was out gunning for reed birds in the marshes around the Island of Juan Fernandez, which is around the corner from the Island of Pekin. His attention was drawn to what he supposed to be a beautiful bird, but which proved to be one of the many lilies growing there. It was afterward discovered that they were planted by Robinson Crusoe, private secretary to Christopher Columbus, who had a summer residence there.

The Emperor dug them up and brought them home to his palace intending to put them in his greenhouse, but his cook happened to see them and supposing they were onions took them into the kitchen, cut them up and was about to put them in the pot. But the Emperor hearing of it ran into the kitchen and dragging the cook out ordered her to be beheaded in two places and hung in three.

Then she was cut up and boiled in her own pot and buried in the kitchen garden back of the palace along with the remains of the lily roots she was cutting up. But the germs of the lilies had life in them, and the old cook providing good fertilizing material they grew to a wonderful size and excited the admiration of the whole China world. The Emperor placed two companies of soldiers over them as guard. They had two cannons. One was loaded with the pieces of the cook's pot, her back comb and hair pins, and the other with pin wheels, chasers and roman candles. These awful preparations struck terror into the whole Chinese nation and from that date these lilies were always considered sacred.

Toronto.

The first regular meeting of the Toronto Gardeners' and Florists' Club was held Wednesday, October 16, at The Steele Bros. Co. King street store, Mr. Geo. Vair acting as chairman pro tem.

The election of officers for first year resulted as follows: President, John Chambers; 1st Vice-President, Geo. Vair; 2nd Vice-President, C. J. Tidy; Secretary, Jno. H. Dunlop; Assistant Secretary, H. Simmers; Treasurer, A. Gilchrist; Executive Committee, F. G. Foster, Wm. Houston, J. Cottrell, W. Lightfoot, A. Ewing, T. Manton and Geo. Reeves.

The constitution and by-laws of the New York Florists' Club with slight alterations were adopted. This was all the business of first meeting, but prospects are good for a lively winter's work.

Mr. A. Macpherson, gardener for Col. Sweny, has a seedling canna that he raised this season that is quite remarkable. The ground color is light yellow with green streaks through it with a bright pink margin on edges. It would remind one of a well marked dracaena. He is raising some of the side shoots that promise to outlive the parent plant in marking.

PUT YOUR SIGN in the new trade directory, and send us copy before December 1. Rates mailed on application.

WE SHALL insert in the new directory a classified index of advertisers, which will greatly enhance the value of advs. and be a great convenience to buyers.

J. ROEHRS,

CARLTON HILL, N. J.

(Formerly called Rutherford.)

Offers to the trade a large stock of Decorative plants in large and small sizes, in highest possible state of cultivation, such as

Areca, Kentia, Phoenix, Chamaerops, Latania, Rhaps, Aspidistra, Dracaenas in variety, Etc.

I issue no Catalogue, inspect stock yourself if you wish to purchase. Only 20 minutes ride by Erie R. R. from foot of Chambers and Twenty-Third Street, New York.

HUGHES

SOLUBLE FIR TREE OIL.

FLORISTS AND NURSESMEN SHOULD NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants: such as ferns, etc. It is used as directed. Used as a W.A.S.I. it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

It kills insect life on man, animal, or plant, without injury to the skin, where parasites may appear.

E. GRIFFITH HUGHES,

Fumigating.

I have found the following method of fumigating very satisfactory, especially with soft stuff such as cinerarias and calceolarias.

For a greenhouse 50x20 feet heat six fire bricks red hot and place in a tin or galvanized iron pan about two feet long, a foot wide and six inches deep. Having previously had some tobacco stems soaking in water, now pour the tobacco juice gently on the hot bricks which are laid flat in the pan. The steam will fill the house in three or four minutes.

I also believe that this method would be advantageous on small places where bouvardias, heliotropes and similar plants are grown in the same house with roses. Omaha, Neb. A.

Suggestive of a Warmer Climate.

Speaking of horse shoes and other odd things sometimes ordered for funerals, we received recently an order by mail for "a fan of suitable flowers with a bow of ribbon at the handle, to be used at a funeral." It struck us as rather suggestive to say the least. Possibly the person who ordered it had seen flat bouquets or something of that sort used and got the idea of a fan from that.

SALTER BROS.

DON'T WAIT until our new directory is published and then complain because the amount of glass owned by you is not given, or is stated incorrectly. Give us correct information now, over your own signature, or hold your peace afterwards.

**Florists' Letters.**

Emblems, Monograms, Etc. These letters and designs are made of the best immortelles, wired on wood or metal frames, having holes drilled in them to insert tooth-picks, by which they are fastened to the design. Give them a trial. You will find these goods to be superior to any in the market. PAT'D AUG. 6, 1889.

NOTE.—All infringers or imitators of the above letters and designs will be prosecuted to the fullest extent.

IF YOU have anything to sell to florists, nurserymen or seedsmen, advertise it in the AMERICAN FLORIST and you will find a buyer if it is a salable article.

IF YOU have any trashy stuff you want to sell don't advertise it in the FLORIST, but if you have a good article and want to sell it at a fair price you can find buyers by advertising in these columns.

ADVERTISERS should bear in mind that the FLORIST is a strictly trade paper and that wholesale price lists may be published in its columns without fear that the wholesale rates there given will be seen by retail buyers. Subscriptions from those who are not in the trade are invariably refused by us. Among those in the trade we include employees of commercial florists and private gardeners who have charge of greenhouses.

Chrysanthemum Show.

Boston.

The chrysanthemum exhibition of 1889 was remarkable for the large number of meritorious seedlings shown and the superb collections of cut blooms which completely eclipsed anything of the kind ever seen here. This evidence of increasing interest on the part of our best growers, together with the large number of visitors at the show, plainly indicates that it will be a long time before this interest will diminish or any other flower usurp the place which the chrysanthemum now holds in public estimation. This is not the pleasantest prospect for the commercial rose growers, who have seen their fall trade all but ruined on account of the chrysanthemum's popularity, but there appears to be no prospect of immediate relief.

The undersigned had the pleasure of visiting two other prominent chrysanthemum shows this season, and while it must be admitted that the display of specimen plants at Boston suffered somewhat in comparison with those in other cities, yet the inferiority was in a large measure atoned for by the comparative absence of those infernal stakes which are used to such an unbearable extent by some exhibitors elsewhere. How any one pretending to have an eye for beauty can deliberately disfigure and utterly destroy the beauty of a well grown plant with a whole forest of painted or unpainted sticks and a tangle of grocer's white twine is beyond comprehension, and how any intelligent committee can award a valuable premium to such crazy contrivances is equally inconceivable.

It will be in order to remark also right here that it would tax ordinary human comprehension to try to understand what certain exhibitors from a distance with a reputation at stake were thinking of when they expressed to this show a lot of stuff with their name attached, of such inferior quality that a street fakir would not disgrace himself by offering it to his sidewalk trade. If such contributions are an evidence of our standing in outside estimation then Boston "culchaw" must have fallen away below par.

To return to the show, the best display of plants in the hall was the set of twelve shown by Jas. Comley, gardener to Mrs. F. B. Hayes. Those shown by E. W. Wood received second prize in this class and were also beautiful plants, being grown low and stocky and requiring very few stakes. The same good point was shown in the plants exhibited by Jos. Clark. Mr. Comley also deserves credit for a fine display of plants filling the whole stage, but not entered for any premium.

For collection of twenty named plants,

all classes, first prize was awarded to Walter Hunnewell, second to E. W. Wood. For six Chinese Dr. Walcott was first, and also first on six Japanese, being closely followed on the latter class by E. W. Wood.

Awards for specimen plants in the various classes were made to H. L. Higgs, H. P. Walcott, E. W. Wood, Dr. C. G. Weld, and others.

The schedule calling for six plants of Japanese varieties in not over 8-inch pots and limited to four blooms each, brought out two very beautiful sets of perfectly grown little specimens from Dr. C. G. Weld and Chas. J. Dawson. Particularly noticeable in Dr. Weld's exhibit were a grand plant of W. H. Lincoln, also Belle Hickey and Wm. M. Singler. Chas. J. Dawson is a son of Jackson Dawson, of the Arnold Arboretum, and this, his first attempt at exhibition, reflected great credit on him.

In the anemone flowered class, Mrs. Gane seems to be about the only variety shown for a prize in Boston and the regularity with which it has been presented for this honor every year begins to be somewhat monotonous.

In the display of cut flowers this year's exhibition is far ahead of anything ever seen here. Eleven large vases of specimen blooms grown by C. J. Power and exhibited by Galvin Bros., were incomparably good. The varieties included were Jardin des Plantes, Cullingfordii, Mrs. Wheeler, Mrs. Frank Thompson, Kioto, Mrs. Alpheus Hardy, W. H. Lincoln and Lillian B. Bird. The manner of exhibiting them was most effective, each variety being represented by about a dozen and a half blooms in a tall vase. The stems were from two to three feet tall and well furnished with luxuriant foliage. In size the blooms were also remarkable. A few of them were measured with the following results: Jardin des Plantes 13 inches in circumference, 4 inches deep; Cullingfordii, circumference 16 inches, depth 4½ inches; Mrs. C. H. Wheeler and Mrs. Frank Thompson 10 inches across; Kioto 16 inches in circumference. Some of the foliage measured 8 inches in length. This one exhibit was a show in itself.

Another most remarkable display of cut blooms was that made by Jas. Brydon, gardener to John Simpkins. Twenty-four such blooms it is safe to say were never before staged in this country. Their uniformity was as remarkable as their size. The following varieties were represented: Thos. Cartledge, Mrs. Fottler, Mrs. J. C. Price, Mrs. Carnegie, Lillian B. Bird, Christmas Eve, Robt. Crawford, Jr., Belle Paule, Mrs. C. H. Wheeler, Grandiflora, L. Canning, Gold, Minnie Palmer, Mrs. J. J. Bailey, Puritan, G. F. Moseman, Edwin Molyneux, Beauty of Kinsessing and Mrs. Frank Thompson.

The Special Premium, a piece of silver

plate, for 50 blooms, divided into 30 Japanese, 10 Chinese and 10 anemones, was won by E. Fewkes & Son, who made a superb display, barring, however, the ten anemones which cut a sorry figure alongside their mammoth companions, and which in the opinion of many should have been omitted from the schedule. The attempt to classify chrysanthemums as Japanese and Chinese is now only a prolific cause of dispute and it is the prevailing opinion among the growers that it should be abandoned.

The cut flowers shown by Kennett Findlayson, gardener to Dr. C. G. Weld, were noticeably good, among the best specimens being W. K. Harris and Nessima.

Among the novelties shown were Ada Spaulding, which was not seen to advantage and proved a decided disappointment, Louis Boehmer, the pink hairy variety shown by Peter Henderson, Sunyside and Mrs. De Witt Smith, from Pitcher & Manda, and Geo. Hollis' seedling of last year Mrs. Ben. Harrison.

John Simpkins exhibited three beautiful seedlings under number. One of these took the first prize for seedling and was named Sandyside. It is very full and large and resembles Mrs. Frank Thompson in color somewhat, being white with a delicate shade of pink on inside of the petal.

Mr. Fewkes showed a superb seedling, in color very near Robt. Crawford, Jr., but larger in flower than that popular variety.

Geo. Hollis exhibited a large number of seedlings, the best of which was Aureole, color straw, petals long and twisted, a full, handsome flower. Other seedlings staged by Mr. Hollis were as follows: Mrs. John S. Fogg, golden yellow, large flower; Jenny Fred, lilac, silver reverse, large; Roxbury, incurved, perfect ball, outside of petals golden russet, inside deep shade but not seen; Ruby Sphere, pale amaranth, tightly incurved in style of Newport; Witch, fawn red, open center, very fluffy flower; Ivoryne, pure white, full flower.

Pitcher & Manda showed a seedling named Bohemia, color brick red, a very full flower.

Exhibits of flowers other than chrysanthemums were few, being confined to a vase of Duchess of Albany rose, grown by Peter Ball for Galvin Bros.; some excellent carnations from R. T. Lombard and F. C. Fisher; orchids from Norton Bros. and the very rare *Cypripedium Maseerellianum*, a hybrid between *C. Spicerianum* and *C. insigne* Chantini, exhibited by Pitcher & Manda.

A singular sport was shown by F. C. Fisher, being a cluster of blooms from the Snowdon carnation, in which one of the flowers was of a beautiful pink resembling Grace Wilder, the other flowers being Snowdons in every respect.

Mr. Robt. Manning, secretary of the Mass. Hort. Society, in a contribution to the Boston *Transcript* gives the following interesting account of the development of the chrysanthemum exhibition: "Now that the chrysanthemum has become perhaps the most popular of all flowers, and, in some points at least, may be said to have reached perfection, it may be of interest to glance at the progress of its culture. The first plants brought to Europe from China were of the small flowering class now known as Pommpons, but they were soon lost, and were not reintroduced until 1846. The large flowering kinds were introduced in 1790. In 1820 there were only twelve varieties in Europe, but in 1865 there were six hun-

dred, and now they are numbered by thousands. The first record we have of their exhibition in this country was in 1830, when fifteen varieties were shown at the exhibitions of this society. The first prizes offered were in 1861 to the amount of only \$17. In 1868 the exhibition was first styled the "Chrysanthemum Show," and the prizes were increased to \$55. The exhibition this year was reported as an entire failure. These had all been "Saturday shows" from 12 to 3 o'clock, but in 1879 it was held on Wednesday from 12 M. to 10 P. M., with prizes to the amount of \$150. In 1882, though planned for only one day, it was so good and so much interest was shown in it that it was kept open two days, and this was continued until 1886, when three days were required, as have been since then. The prizes were gradually increased until 1887, when \$741 was appropriated. It will thus be seen that the expansion of the taste for chrysanthemums and their culture has been mainly within a few years."

WM. J. STEWART.

Philadelphia.

The Pennsylvania Hort. Society has never had such a grand exhibition before, and that means that it was the best chrysanthemum show ever held in the country. I have never seen so many good exhibits nor so few poor ones.

It is worth saying that the winning plants—for the \$100 premium—first and second, were 25 per cent better than when three years ago Robt. Craig put up that stunning twenty-five. Not only in these groups were improvements noticeable, but in all there was better foliage and larger and more perfect flowers.

The first premium was awarded to James Verner, gardener to A. J. Drexel, Esq., for 12 superb plants, the largest of which was nearly 6 feet and the smallest 4 feet 10 inches, the tallest plant was not more than 4 feet high including the pot, each plant had equally good flowers, the foliage was perfect and the group superb. There was a prim methodical contour carried just far enough not to be objectionable. It is possible to carry mechanics too far in plant training, exhibitors young and old should hang up the sign: Beware of mechanical devices in training plants.

The winners were Bride, W. H. Lincoln, Mrs. A. Blanc, Gold, Frank Wilcox, Miss Mary Wheeler, Mrs. Frank Thompson, Robert Crawford, Robert Bottomly, Puritan, Grandiflorum, Mrs. Irving Clarke. Of the 12, 8 were either raised or distributed in Philadelphia. There is always room to mend, and this collection would have been mended had it contained two or more dark colored varieties.

The second was awarded to Gordon Smirl, gardener to Wm. Slingerly, for a superb lot having more contrast in color, and the individual flowers on some specimens were superior to any in the first premium lot. The plants too were generally larger without any attempt at formal training, the foliage of all except a plant of Cullingfordii was perfect. This poor Cullingfordii took off just 11 points; a plant of Puritan lost 5 points from being out of condition, yet withal when the balance was struck the collection was only 5 points behind the first.

The 3d went to Wm. K. Harris for a fine collection, rather smaller and rather uneven when compared to the first and second, yet there was in this lot a plant of Mrs. Wm. Bowen, a magnified Mrs. Wheeler in habit, color and size, which

was admitted by all to be the finest plant in the exhibition. It was 5 feet 6 inches in diameter and nearly as high with 87 perfect flowers.

The other winners in this class were George Fowler, gardener to Joel J. Bailey, John McCleary, gardener to Wm. Wightman, and J. W. Colfesh.

The prizes in the other classes for chrysanthemums in pots were hotly and well contested, being divided in the amateur's class between Messrs. Verner, Smirl, F. R. Sykes, gardener to Mrs. H. Ingersoll, John McCleary, Thomas Monahan, gardener to Chas. Trotter, P. Conlin, gardener to Percival Roberts, and John M. Hughes, gardener to G. W. Childs. What interest is here shown by these gentlemen and their gardeners.

In the nurserymen and florists' divisions Messrs. Harris, Colfesh and Standen took the honors. In the open to all plant class Messrs. Verner, Smirl, Fowler, McCleary, Colfesh, Harris, Monahan, Conlin and Huster were successful.

The "Blanc Prize," a silver cup, was awarded to Messrs. Hugh Graham & Sons for "Harry Elkins Widener," a superb lemon yellow of most perfect shape, large, very double and of good habit. The "United States Prize," a silver cup, for Mrs. Alpheus Hardy, was awarded to H. G. Standen.

The cut flowers were as a rule better than last year, but it is very hard to get 100 varieties together in good condition, and with the exception of the first prizes they were below the average.

Mr. John Cullen was first for 50 blooms, 100 blooms, 25 blooms and 12 blooms, this last being a very fine and excellent selection. Messrs. Harris, McCleary, Fowler and Monahan were the other winners in this class. The displays of seedlings and new varieties far surpassed any previous exhibit. It is to be hoped that some of the varieties will not be perpetuated, however, as there were some that were poor and very poor, a minority being very good.

Silver medals were awarded to Thos. H. Spaulding for Ada Spaulding, to John Thorpe for Coronet, to Thos. Monahan for El Dorado, a superb yellow, to Wm. K. Harris for "Violet Rose," superb pink, John M. Hughes for Mrs. Lay, and to Peter Henderson for Louis Boehmer, a counterpart of Mrs. Hardy except that it is of a silvery pink color, this must prove a valuable acquisition for seed purposes.

T. H. Spaulding had bronze medal for "E. G. Hill," a fine golden yellow. Certificates of merit were given to John Thorpe for Mrs. A. Carnegie, to John M. Hughes for Lady Selkirk, a fine incurved Chinese, ivory white, to Messrs. Pitcher & Manda for "Ramona," a very distinct and fine yellow variety, globular in shape having narrow petals.

Of the other meritorious seedlings and the best of the new varieties with your permission I will reserve them for a future paper. I have notes of nearly all the kinds shown this season which I hope will be interesting.

The exhibition of designs was very very weak for Philadelphia. There was no Battle in it, but there was a fruit store and a wheelbarrow. The displays of roses and carnations were very good, and the prizes went to Messrs. Coles & Whitely, Craig & Bro., Pennock, Evans & Battles. The designs to Kift, H. Graham & sons, Pennock Bros.

The orchid display was of great interest, Messrs. Graham and Evans & Battles having excellent groups which called forth much praise.

FISHING BASKET. [SEE PAGE 183.]

Of the miscellaneous plants such as palms, ferns and foliage plants generally, Philadelphia has never had a better collection, indeed some of the palms and many of the ferns were master pieces of skillful cultivation, and then the competition was lively and close. The plants of *Pritchardia grandis*, *Livistona Hoo-gendorphi* and *L. Chinensis aurea* were gems in 12-inch pots. The larger specimens were *Areca Forsteriana*, *Livistona rotundifolia* and *chamærops*.

Of the ferns shown fine plants of *Cibotium regale*, *Davallia Fijitiensis plumosa* and choice *gleichenias* with immense specimens of *Maidenhairs* were shown by several exhibitors.

The ornamental foliage plants were effective and well grown, some fine species of *anthurium* such as *Varoqueanum* and *Veitchii*; the two velvet leaved plants *Cyanophyllum magnificum* and *Sphaeogynë latifolia* were admired by all. For 25 ornamental foliage plants in 10-inch pots, 1st Wm. Joyce, gardener to Mrs. Baldwin, 2d Robert Wark, gardener to Mr. C. Clark; 15 decorative plants, 1st and special to Wm. Joyce; specimen plant, 1st Wm. Lafferty, 2d Robert Wark; specimen croton, Robert Wark; 25 palms, in not larger than 10-inch pots, 1st and special to Thos. Long, gardener to A. J. Drexel; specimen palm, Wm. Joyce; 25 ferns in 25 varieties, 1st and special to Thos Long; lycopods and ferns, 1st Wm. Joyce; 6 marantas, 1st Hugh Graham & Sons, 2d Wm. Joyce; specimen maranta, 1st Wm. Joyce, 2d Robert Wark; spec-

imen *dracenas*, 1st Wm. Joyce, 2d Robert Wark.

Special premiums were awarded to Messrs. Dreer, Ball, Campbell and Heacock for beautiful collections of trade decorative plants, consisting of very useful sized palms, ferns, *dracenas*, *pandanus*, etc.

Messrs. H. A. Dreer and Jno. A. Gardiner had attractive displays of various bulbs, tools, mushroom spawn and other reasonable commodities tastefully and very effectively arranged.

The decorations of the hall were in good taste, though not quite as elaborate as last year. The only D. D. L. Farson had a very able lieutenant in Davie Bearn, the officers vying with each other to do more than their duty.

Mr. Wm. Bowen, through the D. D. L., presented Mr. W. K. Harris with a set of gold sleeve buttons in honor of Mr. Harris naming the fine *chrysanthemum* Mrs. W. Bowen. JOHN THORPE.

Orange, N. J.

The autumn show of the Orange Hort. Society is always one of the most interesting held in the vicinity of New York, and this year's exhibition was no exception to the general rule. Taken all round, this has been a discouraging season for *chrysanthemums*, especially trying to the richer colored ones, so the many good flowers seen were the more worthy of commendation.

The two "stars" of this show were

Peter Henderson's new hairy variety and Mr. Spaulding's beautiful seedling "Ada Spaulding." The first named is called "Louis Boehmer;" four of the singular blooms nestling in a gilt basket bedded with *adiantum* were the object of much attention. Its most striking peculiarity—the hairy character—is identical with Mrs. Alpheus Hardy, but the flower is larger, and evidently far more robust. The color is a sort of rosy lilac, not very bright. It looks like a strong grower, and is certainly a decided novelty. It received a certificate of merit.

"Ada Spaulding" is already familiar to many through its appearance at the Indianapolis show, where it received the Harrison Cup, being successful over seventeen competitors. It also received a certificate from the National Chrysanthemum Society. It is a large flower of the Chinese type, broad petaled and globular in shape. The center, as it first opens, is a pale sulphury tint, shading through white to a soft pink on the outer petals. It is a real pink, with very little of the lilac tinge seen in so many *chrysanthemums*—something of the *La France* tint. It is really a most beautiful flower, and its vigor of growth suggests that it will be a very useful variety. It received first prize for the best seedling of any section, and also received first for a design of *chrysanthemums* with ferns and foliage, which showed off its beauties to the utmost. The second prize for a new seedling of any section was awarded to Jno. Keane, gardener to Mrs. David Hoadly, Englewood, N. J., his flower being a very excellent seedling from *gloriosum*; color, primrose yellow, a very large, full flower, regarded as extremely promising.

The display did not seem quite so large as previous years, which may readily be accounted for; owing to the extraordinary season the earliest varieties were pretty well over, and there was difficulty in keeping perishable colors among later ones. There was only one plant of "Mrs. Alpheus Hardy" in the entire show, and the judges discreetly passed this over without any award, it was a decidedly melancholy and dejected specimen. This was a surprise, one expected to see any amount of this admired variety. There were very few blooms of it either; the prize for cut flowers of "Mrs. Hardy" was awarded to Jno. Keane, of Englewood, N. J. The writer was examining some cut blooms with a good deal of interest, struck by their more than usually downy aspect. They were large, fine flowers, and they seemed to have as fine a crop of hair as a Persian cat. Closer inspection showed that they had been packed, as flowers often are, in loose cotton wadding. Naturally, the downy wadding stuck to the hairy flowers, no one could remove it, so "Mrs. Hardy" indulged in a crop of false hair, though no one but a very close observer would be aware of it.

Another noticeable omission was the absence of "Mrs. Andrew Carnegie," but this variety appears to have suffered a great deal from the unfavorable season, both in color and size.

The cut blooms were, with few exceptions, very fine. Some of the varieties shown by J. H. Taylor, of Bay Side, were those introduced by Mr. Fewkes last year, and were very good, notably *Lillian B.* and *Kioto*. The disbudded plants showed the best flowers, naturally; the standards were, on the whole, better than the bush plants, which were apt to be rather too much stacked. One of the best plants noted among the latter was a

handsome bush of E. H. Fitler, the flowers were very large and showy.

T. H. Spaulding secured the largest number of prizes, 19 first and 3 second. Competition for the best six standards was very close, Mr. Spaulding coming in first, Mr. Barr second and Mr. Page third.

The awards were as follows: Plants in pots, 12 distinct varieties, T. H. Spaulding; 6 Chinese, T. H. Spaulding; 1 Japanese, T. H. Spaulding; 1 Pompon, T. H. Spaulding; 1 anemone flowered, T. H. Spaulding; 10 standards, 1st prize Jno. Farrell, gardener to Wm. Barr, Esq., 2d T. H. Spaulding; best pyramid of plants, Peter Hayes, gardener to H. A. Page, Esq.; 50 dwarf plants, 1st T. H. Spaulding, 2d Jno. Farrell. Both very good collections. One variety, naturally grown, (Society's special premium) H. Kindsgrab, gardener to Geo. Schapman, Esq.; 6 naturally grown plants, Society's silver medal (amateurs only), Jno. Farrell; 3 naturally grown plants, Society's bronze medal, Jno. Farrell.

Cut blooms, best collection of 50, 1st T. H. Spaulding, 2d Wm. Tricker, gardener to Judge Benedict, Staten Island, 3d Jno. Cullen, gardener to E. P. Wilbur, South Bethlehem, Pa.; 24 Japanese varieties, 1st H. Spaulding; 12 Japanese varieties, 1st Wm. Tricker, 2d T. H. Spaulding; 12 Chinese, T. H. Spaulding; 12 anemone flowered, T. H. Spaulding; 12 single flowered, 1st T. H. Spaulding, 2d Thos. Jones, Short Hills; 12 Pompons, T. H. Spaulding; best 12 seedlings of 1889, 1st T. H. Spaulding, 2d Thos. Jones, 3d United States Nurseries; best collection, T. H. Spaulding; best vase of chrysanthemums, 1st J. H. Taylor, Bay Side, L. I., 2d T. H. Spaulding; 24 distinct varieties, Society's gold medal (amateurs only), Wm. Tricker; 12 distinct varieties, Society's silver medal, Wm. Tricker; 6 distinct varieties, Society's bronze medal, Jno. Cullen.

There were some fine cut roses, of which awards were made as follows: The Bride, 1st Jno. N. May, 2d J. H. Taylor, 3d Patrick Hayes, gardener to H. A. Page; W. F. Bennett, Jno. N. May; Niphetos, 1st J. N. May, 2d J. H. Taylor; La France, J. N. May; Mermet, 1st J. N. May, 2d J. H. Taylor; Perle, 1st J. N. May, 2d J. H. Taylor, 3d Patrick Hayes; Gontier, 1st J. N. May, 2d J. H. Taylor; any new variety, J. N. May. The prize taker was Duchess of Albany—grand flowers.

Some good carnations were shown by Jno. McGowan, the prize for new variety being awarded to him for his seedling "Miss Lizzie McGowan." It is a fine white, a promising variety. Prize for violets was awarded to H. Kindsgrab, gardener to Geo. Schapman.

Prizes for greenhouse grapes were awarded to Patrick Hayes, gardener to H. A. Page. Collections of stove plants and chrysanthemums, not for competition, were shown by the United States Nurseries. Peter Henderson sent a few of his unnamed Japanese varieties of recent importation, among them was an exceedingly pretty fine-petaled sort that looked like a bunch of gold thread. Mr. Barr's naturally grown plants were really beautiful and reflected high credit on the grower.

Mr. Julius Roehrs, of Carlton Hill, N. J., showed his friends a few blooms from his new rose, as yet unnamed. It was found among Anna Alexieff, and is a large, round, smooth-petaled flower of a lively rose pink, with the fragrance of a Beauty. A very nice thing every one says.

The general arrangement was similar to that of previous years. Every one

appeared to be well satisfied with the show and its management, and it must be scored as another success for the Orange Floral-cultural Society.

EMILY LOUISE TAPLIN.

New Bedford, Mass.

The annual chrysanthemum show of the Gardeners' and Florists' Club held in City Hall the 13th, 14th and 15th of November, was the finest ever held in this section, and by far the most unique and successful held under the management of the club. The entries were numerous and the attendance large.

The largest exhibitor of cut flowers was a local florist, E. S. Haskell, among them being perfect specimens of Mrs. Alpheus Hardy, Mrs. G. F. Moseman, Lillian B. Bird, Mrs. C. H. Wheeler, Mrs. Thompson, etc. This exhibition numbered 150 varieties and was banked with palms and begonias for a background.

The next largest exhibitor was W. S. Brown, whose exhibit was worthy of praise, especially so were his specimens of La Triomphante, Wm. Robinson, R. Bottomly and Leopard; there were 70 different varieties in his collection.

Mr. J. Frank Kirk exhibited 40 varieties, among them being a seedling, greatly admired, resembling M. A. de Lean. A. B. Hathaway, Wm. S. Pierce, Geo. C. Bliss and David S. Snow also had fine exhibits.

Among the private exhibitors were the gardeners of Mrs. J. C. Delano, Wm. J. Roth, Horatio Hathaway, all showing flowers brought to perfection, and the first two named were awarded a special premium for Mrs. Alpheus Hardy, the judge being unable to decide which was the finest.

The collection of seedlings was exceptionally good. John F. Tynan, of this city, was awarded a special premium. The display of cut flowers in baskets was large and tasteful in arrangement. Mr. W. Haskell carried off the first premium in this class.

The center of the hall and ends were devoted to plants in pots; the writer noticed lovely specimens of Gloriosum, Domination, Wm. Robinson, R. Bottomly, Puritan, Phœbus, etc.

It would take too much of your space to tell all the exhibitors and all the premiums awarded. This letter would be incomplete, however, without a reference to the judge of the show and his exhibit. It was Mr. S. J. Colman, of South Framingham, Mass., who filled this position, and I think it must have been to the satisfaction of all. Certainly his own exhibit shown for "exhibition only," single flowers, sufficiently indicated his ability to raise most remarkably fine flowers; it included Mrs. Alpheus Hardy, Lillian B. Bird, W. H. Lincoln, Mrs. C. H. Wheeler, Kioto, and numerous others, one remarkable was Cullingfordii which would measure full 6 inches in diameter.

R. G. DEVOLL.

Hartford, Conn.

There were about twenty exhibitors at the chrysanthemum show of the Hartford County Hort. Society, and the display was as fine as ever seen in this city.

The stage of the hall was tastefully decorated with tropical plants behind which was stationed the orchestra. The largest exhibit of chrysanthemums was probably that of Geo. W. Atwood, which included about fifty varieties. B. E. Beemer, gardener to Senator Silas Robbins, of Wethersfield, had a handsome collection.

Following is the list of awards: Best collection, not less than 25 distinct varieties, and 50 plants, \$25, \$15 and \$10, 1st Barney E. Beemer, gardener to the Hon. Silas Robbins, Wethersfield; 2d John Coombs; 3d William May, gardener to Mrs. James Goodwin. Best 6 Japanese distinct named varieties, \$10, \$5, \$3, 1st James Smith, gardener to Newton Case; 2d C. H. Pember; 3d John O'Neill, gardener to Samuel L. Clemens. Best 6 Chinese distinct named varieties, \$10, \$5, \$3, 1st John O'Neill. Best single specimen Japanese, \$3, \$2, \$1, 1st James Smith, 2d C. H. Pember; 3d James Ralph, gardener to Frank S. Brown, Wethersfield. Best single specimen Chinese, \$3, \$2, \$1, 1st James Smith; 2d B. E. Beemer; 3d James Ralph. Best single specimen Pompon, \$3, \$2, \$1, 1st James Smith; 2d James Ralph; 3d C. H. Pember. Best 3 standards, \$10, \$5, \$3, 1st John Coombs; 2d B. E. Beemer; 3d C. H. Pember. Largest and best collection of cut flowers, not less than 50 distinct varieties, \$10, \$5, \$3, 1st C. H. Pember; 2d B. E. Beemer; 3d William May. Best collection of cut flowers, not less than 10 varieties, \$5, \$3, \$2, 1st C. H. Pember; 2d B. E. Beemer. Best single bloom, \$3, \$2, \$1, 1st C. H. Pember; 2d B. E. Beemer. The best seedling plant of 1889, \$3, \$2, \$1, 1st James Smith; 2d William May; 3d James Ralph; special diploma to Mrs. F. S. McLean, Bloomfield. Collection of palms and ferns, \$5 and \$3, 1st William May; 2d Robert Patchet.

Worcester, Mass.

The fourth chrysanthemum show of the Horticultural Society was the best yet given. The largest exhibitors were H. F. A. Lange, F. H. Wesson and the State Lunatic Hospital. The plants exhibited by the last named were the finest as a whole ever seen here.

Following is the list of prize winners: Best 6 Chinese or large flowered in pots, distinct named varieties, 1st \$6, State Lunatic Hospital; 2d \$5, F. H. Wesson; 3d \$4, Patrick Head. Best 6 Japanese in pots, distinct named varieties, 1st \$6, State Lunatic Hospital; 2d \$5, Joseph Brierly; 3d \$4, G. A. Lovell; 4th \$3, F. H. Wesson; 5th \$2, P. Head. Best 6 Pompons in pots, distinct named varieties, 1st \$6, State Lunatic Hospital; 2d \$5, F. H. Wesson. Best three plants in pots, from amateurs, distinct, not named, 1st \$3, Joseph Brierly; 2d \$2, G. A. Lovell; 3d \$1.50, Mrs. C. E. Brooks; 4th \$1, P. Head. Best display in pots, any variety, 1st \$3, State Lunatic Hospital; 2d \$6, H. F. A. Lange; 3d \$4, F. H. Wesson. Specimen plant, any variety, 1st \$4, State Lunatic Hospital; 2d \$3, G. A. Lovell; 3d \$2, H. B. Watts; 4th \$1, Jos. Brierly. 12 cut blooms of Japanese, named, with long stems and foliage, 1st \$4, A. H. Lange; 2d \$3, H. B. Watts; 3d \$2, G. A. Lovell. 6 cut blooms of Japanese, named, with long stems and foliage, in vases, 1st \$3, A. H. Lange; 2d \$2, Joseph Brierly; 3d \$1, G. A. Lovell. 6 cut blooms of Chinese, or large flowered, named, with long stems and foliage, in vases, 1st \$4, A. H. Lange; 2d \$3, H. B. Watts; 3d \$2, P. Head; 4th \$1, G. A. Lovell. 24 sprays Chinese or Japanese, named, not less than 12 varieties, in vases, 1st \$5, A. H. Lange; 2d \$4, H. B. Watts; 3d \$3, G. A. Lovell; 4th \$2, Mrs. C. E. Brooks. 24 sprays Pompons, named, not less than 12 varieties, in vases, 2d \$2, G. A. Lovell. Tall vase, all one color, long stems, with foliage, 1st \$3, A. H. Lange; 2d \$2, Mrs. J. M. Woodice; 3d \$1, Mrs. C. E. Brooks.

Baltimore.

The exhibits at the chrysanthemum show of the Maryland Hort. Society were not numerous, but the quality of the plants shown was good. Though the show was very beautiful and interesting it is feared that the society will be unable to give another one, as the treasury is empty and the membership has fallen from over 400 to less than 40.

The judges, Alexander Fraser, Charles G. Campbell and Dr. H. A. Brooks, made the following award of premiums: Best 12 distinct varieties large flowered or Chinese, John Donn 1st; best 6 varieties, John Donn 1st; best 12 Japanese varieties, John Donn 1st, James Galloway 2nd; best 6 varieties, John Donn 1st; specimen plant, large flowered or Chinese, Henry Bauer 1st, John Donn 2nd; for Japanese varieties, Capt. Wm. Fraser 1st, Wm. Fowler 2nd; 50 plants in pots, 25 varieties, John Donn 1st, James Pentland 2nd; 25 plants in pots, 13 varieties, John Donn 1st, James Galloway 2nd; 25 cut blooms, distinct varieties, Chinese, John Donn 1st, Wm. Fowler 2nd; 25 cut blooms, Japanese, John Donn 1st; display of cut blooms, John Donn 1st; Wm. Fowler 2nd; display of cut roses, Charles T. Bucher 1st; chrysanthemum design, Mrs. Christil 2nd; artistic arrangement of plants on stage, J. D. Pentland 2nd; group of palms, John Cook 1st.

An effort is being made to relay the foundations of the society on a broader basis and to rebuild it with a view to an enlarged field of usefulness, and it is to be hoped that the florists of the city will not fail to do their share. Some enthusiasm has already been developed in the matter which will it is hoped produce gratifying results. It will certainly be a lasting disgrace to the florists and amateurs of Baltimore if they permit this honored and long useful society to die from lack of support.

New Haven, Conn.

The third annual exhibit of the Chrysanthemum Club brought out a greater number of exhibitors than ever before, and the quality of the plants was said to be higher.

The list of awards is given below:

Six Japanese, 1st \$15, John H. Slocombe, 2d \$10, John Gallagher; six Chinese, 1st \$10, John Gallagher, 2d \$5, Archibald Veitch; four pompons, 1st \$8, John Gallagher, 2d \$4, A. Veitch; specimen Japanese, 1st \$6, John Gallagher, 2d \$3, H. R. Allen; specimen Chinese, 1st \$4, R. Veitch & Son, 2d \$2, W. J. Rowe; trained standard, 1st \$6, J. H. Slocombe, 2d \$3, same; seedling, 1st \$6, A. R. Hill, 2d \$3, H. R. Allen; five chrysanthemums not listed in club's catalogue of 1888, preference being given to newest varieties, 1st \$15, Archibald Veitch.

Springfield, Mass.

Owing to the unfavorable weather the attendance at the chrysanthemum show was not very heavy, but the exhibition was the largest and best ever held here.

The largest and finest exhibit of plants was that of Mr. Mieliez. The next largest was that of C. H. Denison. The United States Nurseries, Short Hills, N. J., and C. S. Power, South Framingham, Mass., exhibited fine specimen cut flowers.

Following is the list of awards: 12 plants, named varieties, Mieliez Horticultural Co. \$25, C. H. Denison 20, J. E. Taylor 12, Gurdon Bill 6; display of 6

plants, Mieliez Company \$12, C. H. Denison 10, J. E. Taylor 6; 3 plants, Mieliez Horticultural Co. \$8, C. H. Denison 5, Gurdon Bill 2 50, J. E. Taylor 1; single specimens, C. H. Denison \$7, Mieliez Horticultural Co. 5, Gurdon Bill 2 50, J. E. Taylor 1; specimen standards, C. H. Denison \$7; 3 standards, C. H. Denison \$12; single specimens, unlimited, Mieliez Horticultural Co. \$7, J. E. Taylor 5; 12 dwarfed plants, Mieliez Horticultural Co. \$10; collection of seedlings, R. H. Smith; cut blooms, Mieliez Horticultural Co. \$10, E. H. Howland \$3; 25 cut blooms of named varieties, Mieliez Horticultural Co. \$7; 12 cut blooms, Mieliez Horticultural Co. 6; single blooms, Mieliez Horticultural Co. \$2 50.

Roses, Mieliez Horticultural Co.; carnations, named varieties, E. H. Howland \$3, Dexter Snow 2; carnations, single blooms, E. H. Howland \$1, Dexter Snow 50c.

EDWIN LONSDALE.

EVANSVILLE, IND.—The chrysanthemum show was a grand success. The people turned out in force and the local press praised the exhibition highly. First premium for 25 plants, \$25, was awarded to the Floral Gem Greenhouse, 2d \$15, Wm. Blackman & Son; 1st for 5 standards \$10, Floral Gem Greenhouse, 2d \$5, Wm. Blackman & Son; for best plants any variety, \$5, Floral Gem Greenhouse. The Floral Gem Greenhouse also received specials of \$10 for six plants, six varieties, \$10 for picture frame of "mums," \$5 for best vase of chrysanthemums, \$5 for best three plants and \$10 for pyramid of chrysanthemums; Wm. Blackman & Son \$10 for stand of plants, silver cup for best table decoration, \$10 for standing cross of chrysanthemums, for plant display, \$10 for trade mark of chrysanthemums, \$10 for best T of chrysanthemums, \$5 for best bouquet; J. H. Wade & Co. \$25 for best trade mark of chrysanthemums, \$10 for novel design, \$10 for original design, \$5 for plaque; John Ellspermann \$10 for fan of chrysanthemums, \$5 for basket of cut flowers and chrysanthemum design. Much of the success of the show was due to the efforts of Mr. J. D. Carmody.

NEW BRITAIN, CONN.—The exhibition of chrysanthemums and other flowers by the Horticultural Society was a pronounced success. C. S. Mason of Framingham, made the largest single exhibit, having 150 plants, all good varieties. The best exhibit by an amateur was made by Clark Hine. Others who had fine

assortments were J. A. Trant, J. Thorniley, J. C. Blake, John Gerard, A. J. Sloper, Mrs. J. H. Minor, Miss Kate Stanley, Mr. James H. Shepard, Renben Mitchell, Samuel Bassett, Charles Andrew, Mrs. B. N. Comings, James Cochran, John B. Talcott, Mrs. Ira Porter, B. M. Hurlburt and Senator Robbins, of Vethersfield. A large number of cut flowers from the United States Nurseries, at Short Hills, N. J., attracted much attention and admiration.

WILMINGTON, DEL.—The first chrysanthemum show ever given in this city was held at Odd-Fellows' Hall, beginning November 14, under the auspices of Florists J. L. Brown & Co., L. E. Baylis, J. N. Lewis & Bro. and G. W. Brinton & Son. Over 500 plants were shown, many of them specimens and choice varieties. In addition to the exhibits made by the local florists named above, cut blooms were shown by Pitcher & Manda, Short Hills, N. J., and T. H. Spaulding, Orange, N. J.

CAMDEN, N. J.—At our first chrysanthemum show at least 150 varieties were shown and much interest was manifested by the public. C. W. Turnley was the sole competitor and of course received all the premiums. Mr. Turnley exhibited a number of seedlings which were much admired. The exhibition was repeated at Haddonfield, six miles distant, the following week, and a like interest was shown there.

DETROIT.—The chrysanthemum show given at the Detroit Rink by Florists J. Breitmeyer & Sons, Detroit Floral Co., S. Taplin, Holzgang & Noel and B. Schroeter was a very gratifying success. The exhibition achieved immediate popularity and the attendance was very large. No premiums were offered, it being merely a display by the florists above named.

NEWPORT, R. I.—Florist Brandt made a very excellent exhibition of chrysanthemums in Odd-Fellows' Hall. The collection included many of the choicest varieties of recent introduction.

MONTGOMERY, ALA.—November 12 was cut flower day at the exposition and a superb display of chrysanthemums was made by the local florists and amateurs.

HINSDALE, ILL.—At a chrysanthemum show given at one of the churches here some excellent plants were shown by Mrs. S. P. Gardner.

OUR REPORT of the Cincinnati chrysanthemum show not having arrived by time of closing for this number, will be published in next issue.

Edwin Lonsdale.

We present herewith a portrait of Mr. Edwin Lonsdale, the second secretary of the Society of American Florists, and a frequent contributor to the columns of the FLORIST.

Mr. Lonsdale has a large and well appointed rose growing establishment at Chestnut Hill, near Philadelphia, and a more genial gentleman is not often met, even among the members of the craft in the Quaker city. He has been a member of the Society of American Florists since its organization and a contributor to the columns of the FLORIST since its birth.

In deference to Mr. Lonsdale's modesty we shall say nothing as to the prominent part he has taken in building up the S. A. F. to its present high position.

Hardy Perennials for Forcing.

BY WM. FALCONER.

There are two points to consider, first, what kinds are worth forcing; second, which among these kinds are adapted for forcing.

Most every hardy herbaceous perennial of moderate growth can be grown in the greenhouse and forced into flower earlier than it would bloom naturally out of doors. But I don't believe it would pay the cut flower florist to force columbines, veronicas, or other flowers that are not individually large and showy and capable of good use as cut flowers, and they must also travel well.

Some good flowers for forcing are tree and herbaceous pæonias, white foxgloves, white and rose Canterbury Bells, double pinks, early yellow hemerocallis, hardy cypripediums, white trillium, some lilies, pyrethrums, Newman's rudbeckia, and the like. Among the hardy plants that are already extensively forced every where may be mentioned *Astilbe* (*Spiræa*) *Japonica*, tulips, daffodils, poet's and other species of narcissus, and lily of the valley.

In order to get good satisfaction in forcing hardy perennials we should have good varieties to begin with, and good, strong, well rooted, compactly built plants that made a good growth early in the season, and that were lifted and potted early so as to get them well rooted and established before cold weather set in, and then well rested. And in forcing them we should bring them in gradually and not with a rush; just use the same rational care with them that we do with roses or other regular crops. When grown and forced in pots they are easily handled and we can bring them in as we please and humor them as we think may suit them best, and I would strongly advise beginners with this class of plants to try them in this way first, and until they have found out by experience just how to handle them. But to force these plants on a large scale we have got to ignore potting and take to bench planting with many of them. But here too the preparatory care is much the same—good, vigorous, stocky, mature plants, early ripened and well rested, and which had their roots cut around in fall so as to insure good lifting in winter and little check in starting and blooming. By growing them all close together or lifting them early in fall and heeling them in close together and then covering them deeply with dry oak leaves before winter sets in, we can get at them to lift them and bench them any time we please during winter.

Herbaceous pæonias have large tuberos roots like rhubarb, and are mostly too big for pots; I plant them in old nail kegs, which I get at the grocery stores for nothing. The old early double "scarlet" is the best early, but many of the others only a week or ten days later are splendid. Albiflora, although single, is very effective. Tenuifolia, both single and double, would stand at the head of this class were they plentiful enough, but they are not, and the clumps are usually quite small.

Tree pæonias are better than the herbaceous group and come in earlier, but their expensiveness is a serious drawback to their use. But by growing them permanently in pots, forcing them in winter and plunging them outside along with our poinsettias and stevias in summer we can partially surmount this difficulty.

White foxgloves either as plants in

bloom or cut spikes are mighty nice things to have at Easter, and we can have them then with very little trouble. Rather young plants may not bloom, so be careful to use mature stocky plants and lift and pot them early. Always pot foxgloves. Before winter sets in shorten in the leaves a good deal for handiness in packing close together and as a precaution against rotting off.

Canterbury Bells. I prefer the calycantha type and New Rose, Mauve Queen and pure white varieties; there is a good deal of trash among ordinary blues. For forcing they should be sown in spring and grown into stout stocky plants during summer, and lifted and potted early in fall and wintered in a cold frame well protected from hard frost, for they are not very hardy. For blooming in May and June out of doors I always raise my plants from seed sown about midsummer; if sown in spring the plants would be so large and leafy they would be apt to rot off in winter, but this is rather late for plants for forcing.

Double pinks of many kinds and colors. Grown outside into stocky plants, lifted and potted early in fall so as to get well rooted before frosty weather sets in, and plunged pretty close together in a cold frame, there to await our convenience in bringing them indoors. They blossom lavishly, and are very welcome indeed when our winter carnations are about exhausted. And here I would say a word for the summer blooming garden carnations. You know we have no real good yellow among the monthlies, but we have among the "annuals," and we have also dark crimson and many delicately tinted, flaked and frilled varieties. Now we can treat these exactly as we would the double cushion pinks, and I believe you will enjoy the result. You can get up a good stock from seed, and when the seedlings bloom with you discard all the singles and poor doubles and poor colors and hold on to and propagate the choice kinds.

Yellow day lilies (*Hemerocallis*). The two to grow are *H. flava*, the early yellow, and *H. Dumortieri*, the early orange yellow. Naturally these two are in their finest bloom during the first fortnight of June; now mark you *H. graminifolia*, another splendid yellow and common species, does not bloom till July, and any person not acquainted with them might not think there was any difference between them, but there is—from five to six weeks' time in blooming. So be sure you get the early ones. Both are easily raised from seed or division. *Flava* is the ranker grower of the two. Lift in fall and plant them in nail kegs for their roots are large. In forcing the leaves of *flava* will grow rather rank, but shorten them in as you would those of *Ornithogalum Arabicum*, this won't hurt the blooming. And after flowering and spring comes in empty out the plants, divide and plant them out again and wait till the following year before you force them again. Always keep a double set of them.

Hardy cypripediums. They are splendid. Spectabile is the best of all, then come pubescens and parviflorum. Acaule forces well for a year and is showy, but not much for cut flowers, and our other eastern species are not showy enough. And an excellent quality in these cypripediums is that we can force the same plants year after year without injuring them in the least, but, on the contrary, if we treat them kindly they will annually increase and get stronger. Plant the clumps close together and unbroken in

shallow boxes with leafy or peaty soil and chopped sphagnum, and after forcing them take good care of them till fine weather sets in, when they can be placed in a partially shady place out of doors, but they have got to get water all summer long. I have a good many boxes of them that have been forced year after year for several years and they are stronger now than ever they were. At present they are in an open cold frame along with lily of the valley and other hardy plants prepared for forcing and with a 3-inch deep layer of rough leaf-mould over them, and they will remain in this way under frost and snow till needed for forcing. But plants in pots are never exposed in this way as the frost would burst the pots.

White trilliums (*T. grandiflorum*). One of the prettiest and showiest of our early blooming wild plants. I grow a lot of it for forcing and treat it exactly as I do cypripediums. And with the same treatment it blooms two weeks earlier than do the yellow cypripediums, and fully three weeks earlier than does *C. spectabile*.

Lilies. All species of lilies flourish as pot plants, and many are fully as reliable in pots as they are in the open ground. Apart from the candidum, longiflorum, speciosum and auratum lilies so largely grown in pots, I would urge you to try tenuifolium. It is a gem, small but brilliant, extremely early, easily grown and easily flowered. The best way to get up a good stock of it is from seed. Seeds germinate in ten to fourteen days after sowing, and most of the two year old bulbs will bloom.

Pyrethrums, both double and single, but I presume the doubles will receive most favor. In the open air these come into bloom late in May and last in splendid condition well through June. The double white is a prettier flower than a double China aster and we can have it in quantity from February on when we can not possibly have asters. Have two sets and force them in alternate years. The larger and stronger the clumps are grown in summer the better flowers they will produce in winter. Don't pot them, merely lift the clumps undisturbed and plant on benches.

Newman's rudbeckia (*R. speciosa*). The best of its race. Raise it from seed or division and grow it into big strong tufts. Let them have a long, cold rest. The bright yellow flowers and dark cone centers are very striking and contribute a scarce color among winter flowers. Don't start it very early.

Arboretum Notes.

VIII.

There are still a few bits of bright color left here and there among the groups and beds of shrubbery, although November winds have been whistling through the branches for a week. The long rows of conifers in all shades of living green, the clumps of heaths, with their soft neutral tints in green and brown and grey, the "brooms" with their mazes of bright green stems, all these and many others of the indispensable "evergreen" class are and will be all through the dreary winter months things of beauty, but besides these it is surprising to note how many showy and effective things there still are left in the deciduous class. For instance, take *Berberis Thunbergii*, which Mr. Dawson says he thinks has before it the greatest future commercially of any known shrub.

A bed filled with little two year old plants of this looks like a sheet of flame,

ODONTOGLOSSUM PESCATOREI.

so brilliant are the autumn tints on its foliage. The brightest bed of coleus and achyranthus ever seen could not compare with it, and this at a time when coleuses have been out of the question for six weeks. Then the older plants of Thunbergii with their abundant racemes of bright red fruit are equally effective and will continue so long after the foliage has gone. This subject of autumn and winter effects in landscaping has not received the attention it should. Even the color of the wood, or bark, may be made to play an important part. The brilliant vermillion bark of *Cornus Sibericus*, the rich green stems of the cytises, and the odd nutmeg-like white and brown ribbed boughs of *Acer Pennsylvania*, these and other equally effective things all suggest possibilities of artistic combinations in this line.

A most beautiful sight at the present time, one worth going a long distance to see, is a clump of *Spiraea Thunbergii* about eight or ten feet across. Its beautiful delicate foliage shows every tint of red, yellow and pale green, with its little white flowers thickly dotted all through like stars, while from a distance the whole clump appears like a brilliant sunset cloud.

The different varieties of *Calluna vulgaris* form pretty mats of dark bronzy green. One magnificent plant of the "Tewksbury Heath" (so called from having been first found at Tewksbury, Mass., by Mr. Dawson in 1861), is about six feet across, perfectly regular in form and very richly colored.

Lyceum chinensis, previously noted in these sketches, is still a beautiful object.

It holds the foliage well, and the long trailing racemes of bright scarlet fruit remain in perfection till midwinter.

Another very effective fruiting shrub is *Symphoricarpos vulgaris*. This is fairly loaded with fruit. The berries are in bunches much resembling mulberries, and are crowded thickly along the under side of the stems. They are of a rich dark red color.

No shrub in flower can exceed in beauty and brilliancy the different varieties of euonymus in fruit with their abundance of pendent clusters of scarlet berries with capsules red or rosy pink. A variety of *E. Europæus* with scarlet berries and white capsules, known as *frutico-albo*, makes a very fine contrast with the red fruited varieties. Among other unseasonable indications of the mild weather are *forsythias* and *andromedas* in bloom.

WM. J. STEWART.

Boston, Nov. 7, 1889.

Odontoglossum Pescatorei.

The illustration represents a group of *Odontoglossum Pescatorei* from the greenhouses of Mr. Gilmore at North Easton, Mass., Thos. Greaves gardener.

No more effective and beautiful orchid can be grown and shown than the above *odontoglossum*.

Where large quantities are grown they can be had all the year round, although the general flowering time is through the winter and spring months. Nothing can excel the beauty of a bridal bouquet of *O. Alexandree* and *Pescatorei*, the elegant wreath-like sprays are unequalled in

purity and effectiveness. In fact all of this section are good and they can be grown in this country readily at a temperature of from 50° to 60° in winter, keeping them in summer as cool and moist as possible. X.

Fishing Basket.

This basket is particularly adapted to send to a gentleman, should he be fond of fishing it is useful, and in any case it could be used for a wall pocket when the flowers fade, as the shape is very graceful.

This one was filled with *La France*, *Puritans*, *Niphetos* and *Meteors*. The ribbon which represents the straps adds to the effect by being carelessly thrown over the flowers.

We have filled a number of these baskets with solid colors, to the great satisfaction of our customers. II. H. B.

Theory and Practice.

I find that florists and farmers are a good deal alike in their scoffing at what is called "book farming" or "theorists." While there are to be found many florists whose intelligence would shed lustre upon any calling; there are others who, by their loose disregard of their profession, show that they are laggard in the acquisition of real knowledge so essential to men of their profession. When ever there is an attempt to teach them anything new the effort is met with the old stereotyped question regarding the relative merits of theoretical and practical florists, or the comparative value of theory and practice. The practical men, who have no theoretical knowledge, scoff at the theorists, and the latter sneer at the former.

It requires very little experience on the one hand, and not much study on the other to show that each are equally important, only in different ways. Both sides should know that "theory and practice make perfect." Theory together with practical experience will, without doubt, enable men to excel in whatever work they may undertake. Therefore, it should be the highest ambition of florists and others to combine theory with practice and prove the one by the other.

This object may be effected by devoting a portion of their leisure time to study, and by pursuing a systematic course of self culture. The man whose early training has been neglected need have no cause of despondency, because the extra exertion and effort required to educate himself will confer advantages of their own. Of course there are men in this, as in all other callings, who will fail however much they may try to educate themselves. This arises from the fact that though morally all men may be equal, intellectually they never can be so. Consequently the ability of men to educate themselves varies in proportion to the amount of natural intelligence they possess. But in any case study gives quickness of appreciation, enables men to profit by the recorded experience of others, develops a power of concentration, enforces exactness and accuracy, and if properly directed teaches men to classify facts, make proper deductions and reason logically. The knowledge acquired from books is of inestimable value, for without it he is not only almost sure to be narrow minded, but also very slow to receive new ideas or to estimate the value of old ones.

Such persons are very apt to become intolerant of other people's opinions, to assume that all knowledge begins and ends with themselves, or with what they

have learned, and to over-estimate their ability. They are very apt to be self-conceited, a quality which too many in every calling possess, mistaking it for an independent spirit. One of the commonest excuses for ignorance is the stereotyped expression "I am too old to learn." This, if made in sincerity, is a great mistake, as it is a false pride which neglects an opportunity to learn because it comes late in life, and it is a false fear which shrinks from an effort on account of its difficulty.

One fact very important to be considered in this connection is that knowledge throws light upon itself; and it is the first step only that must be taken gropingly, as it were in the dark, as the bugbear in such cases, like shadows, vanish the moment they are boldly approached, and will be found to be mere shadows after all. Truths are, in the main, simple and easy to be understood, and are daily being brought more within the grasp of the ordinary comprehension by means of good books and papers, which may be had at a trifling cost.

ALFRED B. COPELAND.
Springfield, Mass.

Mr. A. E. Whittle says in the last FLORIST that to retain the leaves on this variety they should be held dry as long as possible and then have a good soaking of water. This mode of treatment may suit some particular soils, but certainly not all, and is therefore somewhat misleading. Here we find to retain the leaves on this variety it is necessary to keep the soil in a nice moist condition (not saturated) all the time, and where a plant or plants by any chance gets a little on the dry side the leaves begin dropping immediately, and many other growers in this section have found the same trouble.

But the right conditions for watering plants, particularly roses, is considerably varied in different soils. There is no rule of thumb, or in other words set of rules, for watering which is applicable to all cases, for while the general principal is the same in all cases the actual requirements of each class of soil etc. can only be learned by carefully watching its effects under all circumstances. A plant that is growing freely should never be allowed to suffer for want of water is an undisputed fact well known to every cultivator. Now the condition as to dryness of the soil when the plants are liable to receive even the slightest check varies considerably; in a light sandy soil it would be much quicker than in a moist retentive clayey one.

As a general rule the tea rose should have the soil at its roots while growing kept in a healthy condition, never be allowed to get dry enough to show brown on the surface, or become so moist that it will pack like brick clay when squeezed in the hand. In most soils the best guide to know when a plant wants water is when the soil feels solid to the pressure of the finger (not waiting till it becomes hard), and herein lies one of the greatest

advantages of shallow benches. The soil hardly ever, where reasonable care is exercised, becomes too wet, on the contrary, except in very dull weather, it will take a light syringing nearly every day. In other words the soil can be kept in a nice healthy growing condition without getting too dry or becoming too wet, and the light frequent syringings are beneficial also in keeping down insects, etc., thus a double advantage is secured.

JOHN N. MAY.

The Rose Grower's Song.

I'll sing you a song of the glad days to goom,
When our peesiness will boom as of yore;
When the voice of gresanthemum cranks will
be dumb,
Und gresanthemums plossom no more.
Once again we'll the hill of prosperity glimb,
Und regain the broad station we held in our
brime;
We patiently wait for dot plessed time
When gresanthemums plossom no more.

The retailers' clerks will be outd on the hunt
Nt orters for roses galore;
Garantions will once again goom to the front
When gresanthemums plossom no more.
Mit our Mermetts and Chacks and our Hyprids
so nice,
From the public goot greenbacks und cash will
endice,
Our stuff will be sold for the old fashioned brice
Wheu gresanthemums plossom no more.

Wholesaleers vill den haf to hustle about,
Shtrcet fakirs vill pe only a bore,
They'll goom to our derms or shtep down und
oudt
Wheu gresanthemums plossom no more.
At autumn's approach how the beddlers will
hump,
At the very first frost how the brices will chump,
Our hearts vill pe light und our bocket pooks
blump
Wheu gresanthemums plossom no more.

We've hat all ve vant of dem Chapauese drash,
Dis Mikado und Mandarin lore;
Dere'll soon pe an end of deir headenishness
Wheu gresanthemums plossom no more.
Of incurved und reflexed, quilled, drooping und
shtraight,
Semi-couple und hairy dey'll soon cease to brate,
Dey'll find in opivion der vell deserved fate
Wheu gresanthemums plossom no more.

NO MUM.

Rosa Rugosa.

This rose is not handsome in the same way as a Mermet or Jacq is handsome, but as a shrub. Its foliage is the finest of any rose in cultivation; its habit dense but vigorous, and it is very hardy, early and free blooming and fragrant. Last spring it began blooming May 13, and the first Jacq roses were not in bloom till May 29. Otherwise Rosa alpina var. glandulosa is our earliest rose; some years it is ahead, and at other times rugosa is ahead. As the rose bugs do not come around till about June 1, with rugosa we have at least ten days good bloom unmolested, but with the hybrid roses the bugs take them from their first appearance. Although rugosa bears an immense crop of flowers in early summer it also continues to bear a few all summer long. And in fall its large red hips which are borne in quantity add much to its attraction. The white flowering variety (R. rugosa alba) is in every respect as good, hardy and free blooming as is the typical red flowering form and is one of the loveliest shrubs in cultivation. There is an idea that it doesn't set hips here, but this is erroneous; our plants of alba always bear fruit, and I have a lot of seedlings raised from our own saved seed. One great advantage of this rose is that it thrives and flowers splendidly in hot, dry, sandy ground, and as it forms such a solid bush it shades the ground for itself. It is a great favorite with landscape gardeners, and the supply of it does not equal the demand. W. F.

Mealy Bug on Roses.

This insect is not often very troublesome on roses, but where it is troublesome, a solution of one gill of kerosene to one gallon of water, well stirred, and syringed over all the parts affected, will destroy them, and if done very early in the morning and the plants syringed with clean water two hours after, no harm will result to the plants from its use.

J. N. M.

Landscape Gardening—A Retrograde Movement.

"Things are not what they seem." In this, the closing sentence of Mr. McMillan's admirably written, but I believe on many points totally erroneous paper on "Landscape Gardening," we have the key to his thoughts. He is the type of that familiar figure, which in all ages and on all questions is found arrayed against whatever may be the prevailing tendencies of the age they live in, perpetually dissenting from popularly accepted beliefs, constantly looking backward and fuding in the past superiority to the present, obstinately asserting that their views are right, although the whole world may differ from them, akin to the jurymen, who denounced his fellows as "eleven of the most obstinate men he ever saw in his life," because forsooth they did not see things as he saw them. Such men compel our admiration by so boldly upholding what they feel is right, and are formidable antagonists, being usually armed at all points with apt quotation, keen satire and ancient humor in support of their theories. That such men leave the impress of their ideas with considerable benefit to the issues they attack is undoubtedly true, but unfortunately their enthusiasm blinds them to what is patent to almost every one but themselves, and while they labor to discover a Scylla in the path of others would wreck us on a Charybdis of their own creation.

An evidence of this is shown in Mr. McMillan's attack on variegation in foliage. Green in its various shades he sets up as the only type of the beautiful in leaf coloring. He might just as reasonably condemn the beautiful plumage of the birds and advocate the brown of the sparrow, the black of the raven, or the white of the swan, as the only colors to be tolerated and so dispense with the attractive yellow of the canary, the gorgeousness of the parrot and the exquisite shades of the peacock. He might perhaps with equal force assert that the only beauty seen in the sky lies in a never ending blue, yet millions discern grandeur in its varying moods whether it be the black and leaden grey of its storm-tossed clouds, the bright tinted rays which herald the newborn day and the glowing splendor which so frequently marks its departure. Multitudes admire the rainbow, and he must be bold indeed, who would question its beauty, or suggest changes which would affect its brilliant tints. 'Tis said with truth "that every eye forms its own beauty," but some people, alas, are color blind, and to these we would extend our sympathy while we pity their misfortune.

The mirror has been held up to nature by the brush of the artist and the chisel of the sculptor, why then debar the gardener from attempting with living plants that which genius has accomplished with dull pigments and senseless stone? True, some of his attempts may have been so ludicrous as to inspire the masterly tirade directed against them by

ROSA RUGOSA.

Mr. McMillan—yet even here there is a wide difference of opinion, but his art, for art it is unquestionably—is comparatively in its infancy, and we are certain of far better things. From the rude figures and crude paintings which mark the dawn of art to the Venus de Medici and the Transfiguration of Raphael, is a long step, and while it may be impossible with the materials at his command for the gardener to reach the perfection of the artist, yet by earnest endeavor he can

attain such excellence that he will be in a position to ignore the censure of the hypercritical few whose only argument seems to be founded on moss-grown precedent. He will be certain to win approbation from the multitudes who will flock to see his work on nature's broad fields and under her own canopy. Millions will derive pleasure and benefit from his efforts, who would otherwise be deprived of them, and who luckily have never had the opportunities of his critics

to acquire stilted ideas of the "eternal fitness of things."

To the mysterious process manifested in "sports" by which nature occasionally develops new varieties, we are indebted for many of our standard varieties of "foliage" and flowering plants as well as some vegetables, yet Mr. McMillan's ideas if carried out would result in their entire extinction. His assertion that these can not be reproduced from seed is subject to qualification. The White

Plume and "Golden Self-Blauching" Celeries are "sports," yet they come true from seed. The golden geraniums are "sports," yet they have produced their kind from seed. A marked instance of this occurred in Flatbush, L. I., a few years ago. One of our well known florists sowed some seed saved from Mrs. Pollock and others of that type, which at first were green and were planted out for zonals. In the fall, however, they began to throw out shoots with such superior variegation to the seed-bearing plants that he realized a snug sum from the sale of them. Again in coleus we have numerous examples of the same kind. If a "sport" is propagated and allowed to seed, its progeny will show unmistakable traces of the parent. These instances are sufficient to prove that nature does not disown all her "freaks." He rails against variegation in foliage in general, yet there are few who fail to see beauty in the purple beech, the Japan maples, crotons, fancy caladiums, etc., even though they are "jaundiced with yellow, livid with purple," and in addition are blotched with crimson, pink and other shades. It must be a distorted vision which fails to recognize the beauty of these, or the grand effect of autumn's coloring on the *Ampelopsis Veitchii* in particular, as well as some of our shade trees.

Ridicule is the most effective of all weapons in able hands, and Mr. McMillan makes liberal use of it in handling this subject. It rarely is sound argument, however, and usually becomes a boomerang to those who use it. If the park where he is the presiding genius was to be the accepted model for all others, its acres of dreary monotony would be a sorry exchange for the foliage and carpet beds, which are such an attractive feature in the most of our parks and large private grounds. The principal object in decorating a park or grounds of any description should be to make them as attractive as possible at all times, and nothing does this more effectively than "foliage" plants for the reason that they present a good appearance from the time they are set out until frost, as the summer storms which play such havoc with flowering plants leaves them unscathed. The vast majority of the people who visit the parks are not there constantly and so can not watch the individual plants unfold their beauty. Follow the people to any place where bedding is done well and see where they linger longest. Is it in front of the hardy border, or before some fine specimen of oak or other trees? Will they find greater attraction in a single shrub or in a mass of them? It matters little in what form the beds are arranged—even the phantasmagoria of Mr. McMillan would do, provided it was well done.

The principal thing desired is to make our parks so attractive that the people will be induced to visit them often; that attained, their mission is accomplished. That this can be done better by using "foliage" plants in well executed designs as an adjunct to trees and shrubbery is already proven. Why then seek to change our present system and revive obsolete modes? Far better seek to improve the living present than waste our energies discussing the dead past.

"The shaft at random often sent
Finds mark the archer little meant."

These lines are to my mind peculiarly applicable in this connection. That Mr. McMillan's ideas if carried to their natural conclusion would result in the sweep-

ing away of the entire race of bedding "foliage" plants few can deny, and I very much question if this issue of his teachings is the one desired by him. I would rather believe that their loss would be as deeply deplored by him as many of their most ardent admirers, yet surely he can not fail to perceive that this would be the outcome of his opinions if they were widely accepted. To show how disastrous to the trade unthinking words may prove it is only necessary to recall the reason of the decline of cut flower designs for funeral purposes. Exaggeration and bad taste had brought them somewhat into disuse, but Dame Fashion's first decided frown against the practice took place some fifteen years ago when the most noted of New York's millionaires was about to begin the journey from whence no traveler returns. In arranging for his funeral he had breath left to say, "No flowers." He had accumulated one hundred millions and in doing so had little time to see the flowers by the wayside, so did not want when dead what he could not appreciate while living. His fiat went forth, backed by his millions, and fashion's slaves went down on their knees and obeyed. Thus for years after to nearly every funeral notice from the bereaved in upper tenfold was appended the stereotyped "Please omit flowers," which quickly spread to all classes in servile imitation of the departed Croesus. In this manner was a whimsical fancy gratified which almost destroyed a beautiful custom, while it entailed incalculable loss to the florists of the country.

In like manner have men in numerous instances "bumbled better, or worse, than they knew," and unthinking people might construe Mr. McMillan's sweeping condemnation of ornamental "foliated" bedding into an order to discard the entire class of these most useful plants, which coming from such a source would have considerable weight. That he would do this in pure wantonness of spirit, those who know him best very much question, and that he would want to be the indirect cause of what might prove to be an irreparable injury to many in the trade, those who know and admire his genial, chivalric nature feel certain that such a consummation was not his intention. We are all human and liable to err, and I trust I have not argued in vain in my honest endeavor to point out to him what I believe to be some of his errors. His frank confession that he might perhaps see things in their wrong light, emboldened me to attempt pointing out to him what I thought was wrong, and I rely on his manly nature to acknowledge such if he sees them in this light.

OBSERVER.

Leaves of Advice From a Limb of the Law.

(For Young Florists.)

X.

Yes, I was present at your chrysanthemum show. It was really a very fine exhibition and you deserve a great credit, for undoubtedly such an enterprise can only be made successful by good judgment, great application and unwearied attention to detail.

I suppose of course you cleared a nice little sum by this exhibition. Five hundred dollars hey? Well, well, that's really a brilliant success.

What's that, fear you have lost it already? Impossible! Let me hear the particulars. Felt so good did you that you went on Slump's note for that amount? Of all men on this bank and

shore of time Slump is the one man upon whose note I would be slow to set my name.

Oh, you have good collateral security have you? That's quite another matter. How's that? Not delivered yet? You don't mean to say you went on the note before receiving the security?

Have his most sacred promise have you? There is nothing less sacred in Slump's eyes than his word. He proves this himself, hence his proneness to give his profane word when you refuse his sacred word.

Know, O trusting mortal, that a mere verbal promise to deliver stock, bonds or other personal property as collateral security can not be enforced. The delivery of the "collateral" must take place at the time of entering into the contract, it is part and parcel of the contract and you might as well deliver a deed and take a man's word for the consideration as to go on a note because a man promises to give you some good collateral. Ask yourself what the meaning of the term is. It signifies side by side and in addition.

The very essence of such a contract of endorsement is simultaneous delivery of the "side piece." You have often heard me say that when a contract is in writing (and an endorsement is a written contract) the law supposes that everything connected with that contract should appear in the writing; not necessarily in the same instrument, but in some instrument bearing even date and referring to the note so that both may be construed together.

Pretty generally when a man talks about "collateral" he means stocks, bonds, bills of lading, warehouse receipts etc.; that is some paper evidence of value. But of course any kind of property may serve as collateral.

You may borrow a thousand dollars and hand the lender a deed of your house taking back a proper declaration from him. Or, you may pull your watch out of your pocket and hand it to him, or your diamond ring or watch chain. Anything that has value will serve the purpose.

You must not confound the transfer of property as collateral with the contract called "pledge." In the latter case, the pledge simply secures a right to sell the property on default. But he must sell it according to the manner presented by law, or he will not free himself from obligation to the owner. Quite otherwise is it with collateral.

Here the lender holds an absolute transfer in blank. The moment the borrower makes default the collateral may be sold. True, there must be a formal notice, but it is generally waived. No judicial process is necessary.

Yes, such a course is summary, but in no other way could a business man be secured against sudden emergencies. A half hour's delay might swamp the staunchest house.

Ah yes, I am coming to that. When a man lends money on a written instrument he must look well to it that the person putting up the collateral has a legal right to do so. I mean such a case as this: Suppose one of the firm of Wood & Ware comes to you to buy a large bill of goods to stock his conservatory and offers you his personal note. You are a little suspicious and ask for collateral. He then offers to assign you a partnership claim as collateral security. Naturally he would have no right to make use of partnership assets to bolster up an individual claim.

So too in all business relations with minors or with people who are acting in a "representative capacity," such as guardians, executors, administrators, assignees, receivers, etc., be careful how you make contracts with them. Their powers are limited by law, and what is more, the law expects you to know what those powers are.

Another point to which I want to call your attention is this: Take care that any collateral security in the shape of a note of hand, bill of lading, bill of exchange, or negotiable instrument of any kind should be indorsed over to you or your order. Don't permit a personal indorsement for you might want to borrow some money on the collateral at once, that is to "rehypothecate" it as it is called.

A collateral security of any kind may not be diverted from its specified course. For instance, if you borrow some money from me and deposit a bond as collateral I can not upon your payment of that specific loan refuse to deliver up the bond and hold it against some other claim I may have against you.

Never pay a debt secured by collateral without demanding the return of the collateral then and there. Any other course is dangerous. In this way many simple business transactions have been transferred into vexations, quarrels, and finally into expensive law suits.

Oh, yes, Slump may pay. Any way the chrysanthemum show was a big success. **UNCLE BLACKSTONE.**

AN IMPORTANT LEGAL DECISION.

In the issue of the *Gardener's Chronicle* for November 2 appears an account of a ruling by an English court which can not fail to be of great interest to the trade.

The plaintiff had purchased from the defendant 500 roots of what was represented to him to be *Spirea palmata*, but when the plants bloomed they proved to be *Spirea elegans* which was comparatively valueless to him. He therefore claimed the amount which he would have received for the plants had they been of the variety represented to be.

There was no charge of fraud against the defendant as it was evident that he had sold the plaintiff what he thought was *Spirea palmata*.

The jury found for the plaintiff for the full amount claimed and judgment was given accordingly. Leave to appeal was given.

This establishes an important legal precedent, which should be borne in mind by those in the trade.

It is certainly no more than just that those who make errors of this kind should bear the expense caused by them and not be able to throw the loss upon the purchaser who has relied upon the seller's accuracy as well as his honesty. To have a man who has through his error caused you a serious loss simply state that he is sorry for the error but can not make the loss good is a treatment of business obligations which would not for an instant be tolerated in any other business, and should not be in this.

This precedent will be of considerable value in any attempt to recover for losses incurred through substitution on the part of sellers, as the defense of the substitutor will always be that the substitution was the result of error rather than intention. The case cited shows that one court has decided that the seller is responsible for such losses even though there be no intention to defraud. Now let some American florist who has suffered a loss of this kind bring suit and recover the amount of his loss. We believe that he can easily do so if his chain of evidence is complete. Such a judgment would we believe result in considerably lessening the number of genuine errors by making sellers more careful in labeling and in the selection of employees to put up orders, and would have a very salutary effect upon those who substitute intentionally.

Who will be the one to take up the matter to benefit not only himself, but the whole trade as well?

COMPETITION.

A subscriber writes: "We are a slow lot here except when it comes to cutting one another, and that we can't do much longer, for we have cut to starvation

prices. I see no hopes of ever having a Florists' Club here, for every man would go prepared to throttle his neighbor. Oh, we are a hard lot here!"

We can not but believe that the writer of the above has an exaggerated idea of the hopelessness of the situation. The formation of a Florists' Club should not be for the purpose of regulating prices, for we believe that any attempt to do so by direct means will invariably fail and have an injurious rather than a beneficial effect. But we do believe that a Florists' Club has a strong tendency to relieve such a situation as our correspondent has described by bringing those in the trade together, making them better acquainted with each other, uniting their interests and impressing upon them the fact that their interests are common.

To the closer social relations we attribute much of the good accomplished by these clubs. Those who have before rarely met their brethren of the craft, and then only for a few minutes at a time, are almost invariably surprised to find upon closer acquaintance that they possess qualities of head and heart never before suspected, and that they are really first rate fellows. With this discovery comes a kindlier feeling on the part of all, which if maintained will result in the gradual removal of bitter, unreasoning and unwise methods of competition.

We shall have to admit that there are some men who are so constituted that they can never maintain pleasant relations with their fellows, but such cases are fortunately extremely rare, in fact we doubt if they will average one in a thousand. But even if this thousand man happens to be in your city that is no reason why you should not receive the benefit of more fraternal relations with the others. If you have come to the conclusion that all in your city are hopeless cases while some of them manage to maintain agreeable relations among themselves, better look well to yourself, that isolated case may be in your own person.

Again, don't wait for the other fellows to make the first advance. If all wait how is a start to be made? We recommend our correspondent to make the first advance himself in his city. Visit around among the other florists and talk up the project of a club. Get a number of the more progressive ones to give it the weight of their approval and then issue a postal card call to every florist in the city to meet at some specified time and place for the purpose of organization, signing the names of those you have talked with and who have favored the project.

After your club is formed have a little patience in waiting for results. Don't expect that the millennium will follow or that the improvement can be discovered with the naked eye all at once. It will take time to soften hearts which have been hardened by years of misunderstanding, but that good will have been accomplished in a very short time, even from the first meeting, you may rest assured even though it be not plainly apparent.

In the retail trade unwise and unreasoning competition has been indulged in to a very great extent, with the result of injuring all alike where it has prevailed. But don't blame it all on the other fellows. Look to yourself and see if you have not been as guilty as others. Be honest with yourself and act accordingly.

JOSEPH LINCOLN, College Hill, O., sends a few blooms of a bouquet which

he states is a sport from elegans. The flowers were so badly dried up when received that we could form no opinion as to whether it might be considered an improvement on elegans as thought by the sender.

NEW CARNATIONS.—Chas. T. Starr, Avondale, Pa., sends us blooms of three new carnations. J. R. Freeman is a violet crimson with fringed petals and very fragrant; Wm. F. Dreer deep pink of good size, full and fringed; Golden Gate, clear golden yellow, full and of good size.

THE HUMOROUS "HISTORY OF THE origin of the Chinese 'sacred lily' which we printed in last issue, was it appears, copied from the *Practical Farmer* of Philadelphia, though sent to us as original.

News Notes.

LARNED, KANSAS.—W. T. Jackson, florist here, has made an assignment.

SCRANTON, PA.—T. B. McClintock has opened a new florist store at 314 North Washington avenue.

MINNEAPOLIS.—A chrysanthemum ball was a recent event in society circles. Great quantities of these flowers were used in the decorations.

RUTLAND, VT.—The greenhouses and their contents be'onging to W. D. Lane were completely destroyed by fire on the morning of November 20.

KANSAS CITY.—At a recent wedding chrysanthemums were the only flowers used in the decorations. It was termed a chrysanthemum wedding by the daily press.

CLEVELAND.—Florist E. G. Campbell gave an exhibition of chrysanthemums at the greenhouses on Jennings avenue which was much commended by the local press.

SYRACUSE, N. Y.—J. Neal Perkins, known to the trade through his connection with the Syracuse Pottery Co., died recently. Sipfle, Doppelf & Co. succeed the old firm.

BUFFALO, N. Y.—The florists here had to give up the project of a chrysanthemum show this fall but will be ready for one next year, and also intend to have an exhibition of roses and spring flowers before Easter.

BATH, ME.—Fire did considerable damage to the greenhouses of Z. H. Trufant Nov. 12. Loss is estimated to be about \$1000 on buildings and \$500 on plants. There was no insurance. It is believed that the fire was incendiary.

BALTIMORE.—At a meeting of Maryland florists November 18 a Floral Exchange was organized and officers elected as follows: President, Robert J. Halliday; Vice-President, John Donn; Treasurer, E. A. Seidewitz, of Annapolis; Secretary, William Feast; Executive Committee, John Wiede, William Fraser, I. E. Moss. The object is to establish for their purposes an organization similar to the Corn and Flour Exchange and the Produce Exchange. The Baltimore Florists' Club has elected the following officers: President, Robert J. Halliday; Vice-President, Wm. Fraser; Treasurer, William B. Sands; Financial Secretary, Charles G. Campbell; Secretary, Wm. McRoberts, Jr. The affairs of the club are making good progress.

Naming New Vegetables.

The committee on nomenclature of vegetables of the Association of American Agricultural Colleges and Experiment Stations, report the following:

RULES.

1. The name of a variety should consist of a single word, or at most of two words. A phrase, descriptive or otherwise, is never allowable; as, Pride of Italy, King of Mammoths, Earliest of All.

2. The name should not be superlative or bombastic. In particular all such epithets as New, Large, Giant, Fine, Selected, Improved, and the like should be omitted. If the grower or dealer has a superior stock of a variety, the fact should be stated in the description immediately after the name, rather than as a part of the name itself; as, "Trophy, selected stock."

3. If a grower or dealer has procured a new select strain of a well known variety it shall be legitimate for him to use his own name in connection with the established name of the variety; as, Smith's Winningstadt, Jones' Cardinal.

4. When personal names are given to varieties, titles should be omitted; as, Major, General, Queen.

5. The term hybrid should not be used except in those rare instances in which the variety is known to be of hybrid origin.

6. The originator has the prior right to name the variety; but the oldest name which conforms to these rules should be adopted.

7. This committee reserve the right, in their own publications, to revise objectionable names in conformity with these rules.

A hybrid is the product of true species. There are few, if any, instances of true hybrids among common garden vegetables. The union of varieties gives rise to a cross.

MR. A. W. SMITH corrects us as to the name of the new watermelon, which he says should be "Ruby Gold," and that J. L. Childs purchased the entire stock.

Horticultural Education.

I am glad to see that the discussion of the question of horticultural education has been started. There is no doubt that the training in practical horticulture in the most of our agricultural colleges is and must of necessity be a mere farce. Men cannot teach effectively what they do not thoroughly understand themselves.

The great majority of those who are engaged in teaching horticulture in these colleges have only a theoretical knowledge of the art. They have never "fought frost" winter after winter; they have never been in the keen competition of producing plants and flowers for a critical market. They have never worked weeks and months to discover the exact needs of a "finicky" orchid or some other plant needing peculiar treatment. They have never come in competition with real gardeners in producing specimen plants, fruits or flowers to be criticized by expert judges at a great exhibition. In a word, they have simply studied books and not things.

Emerson well said that "manual labor is the study of the external world." No matter how much a man studies of what other men have done in any line of practical work, he will never fully comprehend the subject until he handles and studies the work itself. The writer has all his life dreamed of an ideal horticultural school, and hoped to realize it, but the dense ignorance of those who direct the financial affairs of institutions where horticulture in all its branches should be effectively taught, ever interferes with true progress in this line. I am almost inclined to think that our State Agricultural Colleges will never develop thorough schools of horticulture and that the only hope is for a school founded and sustained by those directly interested in the full development of the art, the nurserymen, florists and seedsmen of the land. The scope of the art is so broad that no commercial establishment can properly train young men in all its branches. Such an institution should not be a mere trade school, simply to train florists, or nurserymen or seed growers or landscape gardeners, but a school where a thorough laboratory training in the anatomy and physiology of plant life, and in systematic botany would run parallel with practical work in floriculture, plant growing, forcing of fruits and vegetables under glass, kitchen garden, orchard, vineyard and nursery work, where true taste in landscape art is incul-

cated by precept and example and the effort is made to develop brains and capacity in every department. Then the graduates would be ready to take up any department as a specialty and prosecute it successfully. The time and the men capable of doing all this will seldom if ever be afforded by our Agricultural Colleges. The almost invariable practice has been to locate these institutions on the poorest tract of run-down land which the State can buy or some one give them to get rid of it, and the trustees imagine when they have appointed a Professor of Horticulture and built one little 8 x 10 greenhouse that they have given horticulture its full share in the institution, when they have simply made it impossible for the most capable man to do effective work.

Let us have a great horticultural training school, where the professors are not afraid to stain their fingers in laboratory and garden nor ashamed to don a blue apron and lead a class with skilled fingers in any line of practical work. The nurserymen, florists and seedsmen of the United States are well able to found and sustain such an institution and one such school, well endowed and properly manned will do more for American horticulture than all our agricultural schools will ever do. In the line of landscape work it is true that "Poete nascitur, non fit" is true to a great extent, but such an institution would do much to develop latent talent in that line, and to correct much that is now erroneous and ridiculous.

W. F. MASSEY.

N. C. College of Agl. and Mech. Arts, Raleigh, N. C.

SEND in your order now for a copy of the new directory, price \$2. It will be ready January 1 next and will be a great advance on the old one. We have spared no expense or labor to make the list perfect, and from the enormous number of changes made from reliable information we believe it will be as near correct as it is possible to get it.

We can now furnish in any quantity desired Debit and Credit Tickets of which we give below samples reduced one-half in size.

DEBIT. <i>Jan'y 10 1889</i>			
<i>John Smith</i>			
100	<i>Verbena</i>	3	—
50	<i>Geranium</i>	4	—
		7	—

CREDIT. <i>Jan'y 10 1889</i>			
<i>Richard Roe</i>			
500	<i>4 inch pots</i>	5	—
174	<i>2 1/2 "</i>	5	—
		10	—

The debits are printed in black and the credits in red, so they can be readily distinguished. They are put up in blocks of 100; 50 of each, placed back to back; thus but one block will have to be carried. By means of these tickets an entry of a sale or receipt of goods can be made anywhere—in the house or in the field—and afterwards filed. Tickets for each transaction in your business will make data from which a book-keeper can readily work. With this simple and easy means of keeping a record of your business you can afford to neglect so important a matter?

185 Water Street, NEW YORK

Nomenclature.

In a lengthy article on page 160 Mr. Whittle enquires what has been done by the committee appointed a long time ago, as then understood, to correct errors in the names of plants sold by the trade, and to give us the original and only correct names. Mr. Whittle was, I believe, one of that committee, and should know if anything has been done. As an outsider I should say that nothing had been done, but I may have made a mistake, not being posted.

I have some recollection of another member of the committee writing favorably of an individual who sold some old rubbish at ten times its value as the Aurora Borealis plant or something of that sort, for the reason that no one would buy it at any price under its proper name.

Mr. Whittle enquires who made Reichenbach an authority. All botanists and orchid growers who know his life-long researches among these plants.

After propounding this question he has an itchy sensation, and wishes to know who gave the name of Scabiosa to one of our old-fashioned plants. The name does not mean the itch, but was applied because the plant was supposed to cure that disease, according to a German botanist who edited one of Linnaeus' books. It would certainly be a strange commencement for a few members of this committee to change a name because of unpleasant associations, when probably not one person in ten thousand, outside of botanists had ever thought about it, and Mr. Whittle did not know its origin. If this is to be the best result the committee had better be discharged.

Maywood, N. J. JAMES TAPLIN.

Carnation Cuttings.

In reply to Mr. William Russell of Walkerton, Ont., I may say that it is customary with carnation growers generally, to select their cuttings during the winter while the plants from which they are taken are flowering their very best. And my article which appeared in the FLORIST November 1, which Mr. Russell refers to, is no departure from that custom, except so far as I urge the necessity of securing the cuttings as much as possible during the month of December, before the plants are enervated by excessive heat, which if such a condition happens, is more likely to do so just before and during the holiday season than at any other time.

I cannot see why good, healthy cuttings should not make flowering plants even if taken from a plant of any given variety not in flower or not having previously flowered, I never had any such experience.

H. E. CHITTY.

INDIANAPOLIS.—The officers of the Society of Indiana Florists for the ensuing year are: President, M. A. Hunt, Terre Haute; Treasurer, Fred Dornier, La Fayette; Secretary, Wm. G. Bertermann, Indianapolis; Assistant Secretary, John Hartje, Indianapolis. The officers of the Indianapolis Florists' Club are: President, Wm. Langstaff; Secretary and Treasurer, John Hartje.

Boston Notes.

English primroses are among the novelties in cut flowers now seen in the florists' windows.

Some of the local members of the National Chrysanthemum Society are enquiring whether an award for any chrysanthemum was made by this society this year at Indianapolis, and, if so, what for.

H. S. Messenger one of our well known florists died at his home in Milton on November 19, at the age of 42. Mr. Messenger has been in failing health for some months and his death was not unexpected. He was highly respected by all who knew him.

Auction sales of budded roses, spirea and similar fall supplies have been unusually successful this season. A fine stock of this description was sold by N. F. McCarthy & Co. for J. A. De Veer of New York on November 11, and brought good prices.

A delegation of six went from Boston to attend the Philadelphia chrysanthemum show, and the opening of the new reading room and bowling alley of the New Jersey Social Florists' Club. They found everywhere an abundance of that hearty hospitality which is a characteristic of the craft wherever you go, and fittingly wound up a most enjoyable trip by coming home all together.

W. J. S.

Laurestinus.

Replying to L. G. P. it is not necessary to cut back the plants except to trim into shape. This should be done just after blooming. Rich, heavy soil is best. Temperature should be about 50° in winter season.

CUT FLOWER DEPARTMENT.

WOOTTONS.

OUR 20,000 WOOTTON BUSHES WILL BE IN BLOOM AFTER DECEMBER 10th, AND WE CAN THEN FILL ORDERS FOR THE BUDS OF THIS SUPERB RED ROSE IN ANY QUANTITY.

FIRST SIZE blooms frequently excel in size and color the American Beauty, and equal it in perfume.

SECOND SIZE blooms in every way compare favorably with Bennett.

FIVE ACRES OF GLASS containing 80,000 rose bushes grown exclusively for cut flowers. We cut from 10,000 to 25,000 buds per day during the season from December 15th to May 15th.

VARIETIES:

Wootton, Beauty, Puritan, Hoste, Perle, La France, Watteville, Cusin, Bride, Mermet, Gontier.

We also grow large quantities of bulbous flowers, such as Tulips, Roman and Dutch Hyacinths, Narcissus, Lily of the Valley, etc., etc.

Shipments made by United States or Adams Express, or in special cases by Pullman cars. Canadian, North-western, South-western and Southern orders specially solicited.

In telegraphing, much expense may be saved by using the **CODE** which we will send on application.

Telephones 977 and 999. **C. STRAUSS & CO., WASHINGTON, D. C.**

P. S.—Messrs. Strauss & Co. are now ready to make contracts to supply any of the above named Roses in 2½ or 3-inch pots, after April 1st, 1890, at very reasonable rates.

Mention the *American Florist* in your letter when you write.

Use of the Feet in Seed Sowing.

ED. AM. FLORIST:—In the November 1 issue of the FLORIST, C. L. Allen gives Peter Henderson the credit of being the discoverer of the idea of the "use of the feet in seed sowing." I do not wish to detract any of the glory or honor which Peter Henderson has achieved in the horticultural or floricultural world, but thirty years ago when I first commenced to learn the business my father taught me the "use of the feet in seed sowing," and I never heard that Peter Henderson claimed the discovery of that idea until I read the last number of the FLORIST.

HARRISBURG, PA.

HUGHES

SOLUBLE FIR TREE OIL.

FLORISTS and NURSERYMEN SHOULD
NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants, such as ferns, etc., if used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

BOXES. BOXES.
MAILING and CUT FLOWER BOXES.

Read what C. A. Reeser says for our 3-PRICE BOX.

GENTLEMEN:—I write to tell how well pleased I have been with the mailing boxes you have furnished me during the past two years. I think I have ordered 35 or 40 thousand, thus giving them an extensive trial. I think there is nothing in the market that is so satisfactory, at least, that has been my experience, and I have tested nearly, if not quite all the boxes in the market for that purpose.

Yours very truly, CHAS. A. REESER.

New York Notes and Comments.

The great intercollegiate foot ball match was just in time to clean up the last straggling chrysanthemums. All New York seemed afflicted with a new species of yellow fever for a couple of days, and yellow flowers were as much in demand as yellow ribbon. Rather fortunate for the florists that Princeton came out on top, for it would be hard to find a flower just the right color for Yale.

At a recent visit to the Flushing Nurseries of the John Henderson Co., their climbing Perlees Jardins was noted with a good deal of interest. The blooms are large, seemingly a trifle fuller in petals than the ordinary Perle, and well colored; it climbs like a Nid, and appears a strong grower. The specimen plant is a large one, though now cut back for stock.

At this place, and also at J. H. Taylor's, of Bayside, stakes are almost entirely abolished, their place being taken by galvanized iron wire. The wires are fastened to cross pieces above and below, on the middle benches; on the low side benches they are fastened to the rafters, being sloped forward at the same angle as stakes. The many advantages are easily seen. The wires are very much cheaper than stakes in the first place and they will last for an indefinite time; they afford no harbor for insects, and there is literally no obstruction of light, a very important consideration during such a season as this. Mr. Taylor uses these wires with carnations as well as roses; the plan is highly favored by most growers.

Mme. Hoste was seen in good condition at the Henderson nurseries; Mr. Anderson is enthusiastic over it. There can be no question of its beauty, it is full and shapely, and the clear primrose color is most attractive. It appears to flower very profusely, and at present the flowers seem to sell very well. The foliage is certainly very distinct, leaflets rather small and clear cut, color a bright dark green. The only doubts expressed about it are whether the color is distinct enough to hold favor, but there is no other good trade rose of the same clear pale yellow, and we usually find that color has less to do with the popularity or value of a rose than such qualities as size, fragrance and durability. Perhaps we ought to put durability first, for many otherwise good roses are comparatively useless for lack of lasting qualities.

Mme. Falcot is grown at Flushing; it does not seem to hold a front rank in general favor, but its apricot tinge is often admired. Sunset, as seen here, was very fine and well colored. Mr. Anderson said that he found his stock varied so much in tint that he kept discarding all the lighter flowered plants until he got the right tint, which is unquestionably a distinct rose.

Chrysanthemums were over, but among a few belated ones Mr. Anderson pointed out an interesting sport from Mrs. Chas. Carey, which will be remembered as an incurved white, of moderate size and shapely form. The sport is a clear bright pink, unquestionably a very useful flower. The difference in color is quite startling, for the flower retains every peculiarity in shape of the parent. Mrs. Carey does not seem so much grown as many other white varieties, but it would really seem more useful generally than the very large coarse flowers; it can be compared to other flowers without disadvantage, and it is very prolific.

Another very late white chrysanthemum is Mont Blanc; it is a very large flower, straw colored on first unfolding, but pure white when mature. The only trouble is that the bees will not let it alone, and they are apt to spoil the flowers.

At J. H. Taylor's, Bayside, a fine sight was afforded by a houseful of Cypripedium insignis, 250 plants in full bloom. They were all a fine variety, thoroughly well grown, and the effect on entering the house was really beautiful. Some say that steam heating does not suit orchids, but certainly there was no fault to be found with the effects here. Mr. Taylor had been cutting quite freely for Thanksgiving, but expected to keep the majority of these flowers for the holidays.

As chief white carnation, Mr. Taylor grows Silver Lake, and regards it very highly. Its color is good and it has the great advantage of opening quickly; some of the finest white carnations take so long to open properly that their trade value is materially lessened.

Among roses, Mr. Taylor finds Meteor a decided success. Really, it seems to put Jacqueminot out of sight, with its glowing color, velvety texture and fine shape. I believe the first impression was that it would be seen at its best in the summer, but, as seen at Bayside, it is full of promise for winter use. It throws up strong shoots from the bottom, like most hybrid teas, and the blooms are borne on good long stems. The Jaec has not seemed to be of very much account lately, so if Meteor behaves well it will be a favorite.

Mr. Taylor was very fortunate with Mermet, in spite of the season, and he is full of praise for Papa Gontier, which does very well with him. He adopts a similar plan to Mr. Roehrs with his hybrids, planting them in boxes. Mr. Taylor chooses a long, narrow box, in which he can put four plants in line; they are more readily handled than a larger size.

Complaints of the very bad season are prevalent. Some growers complain of losing 50 per cent of their carnations in the open ground, others report the loss of their entire stock. The inability to properly ripen the wood has entailed

large loss in all roses; a good deal of ill luck is reported in hybrids. Trade begins to look up in the beginning of December, but November was a most discouraging month. People don't seem to buy flowers in wet weather, and an average of four rainy days a week grievously affected the retailers. Prices began to improve in December, and we expect a fairly good holiday trade. Prices may not be unusually high, but there is hardly likely to be a glut of flowers.

EMILY LOUISE TAPLIN.

Cincinnati Exhibition.

The chrysanthemum exhibition by the Cincinnati Florists' Society far surpassed expectations, and proved a financial success, the first financially successful exhibition ever given in this city, and the society may well feel proud of its first effort.

The largest exhibitors of plants were Fred. S. Walz, R. Witterstaetter, John Fries and Frank Huntsman.

Among the competitors in cut flowers and floral work, were the Oakley Rose Houses, B. P. Critchell & Co., Cincinnati Floral Co., J. A. Peterson, R. J. Murphy, A. Sunderbruch & Son and J. J. Crnsman of Clarksville, Tenn. J. A. Peterson carried off 1st honors for best 100 cut blooms of chrysanthemums, A. Sunderbruch & Son, 2d, and R. J. Murphy, 3d. In best table designs B. P. Critchell & Co. were awarded 1st, their piece being a large canopy, the underside beautifully worked in Perles, La France, Brides, Bennetts and adiantum leaves, and suspended above a large mirror. The first premium Bride's bouquet shown by Frank Huntsman, was composed of Bride buds with their own foliage, tied with very heavy white silk ribbon.

A very handsome display of orchids anthuriums, pandanus and adiantums was made for exhibition only by J. T. McFadden. A table of cut orchids and chrysanthemums, by Pitcher and Maunda, of Short Hills, N. J., also attracted much attention. Cut chrysanthemum blooms of unnamed seedlings, exhibited by John Thorpe, of Pearl River, N. Y., were considered very fine. M. A. Hunt, of Terre Haute, Indiana, displayed a very handsome bunch of Duchess of Albany Roses. The vase of 25 roses, newest varieties, taking 1st premium, shown by B. P. Critchell & Co., was composed of Hostes, Woottons and Albanys. A fine collection of cut chrysanthemums was entered for exhibition only by J. S. Forster, Evanston, Illinois.

The greatest interest was manifested in the contest for the C. H. & D. K. R. monogram. There being no limit to size, one exhibited by T. W. Hardesty had to be cut in two in order to get it into the hall, and would have taken second had it been completed on time. The one taking first, shown by A. Sunderbruch & Son, was composed of bright blue immortelles for background bordered with white carnations, the raised letters C. H. & D. were two feet in length of Niphetos buds, the whole measuring 5 x 8 feet and resting on an easel 10 feet high, on the right of which was tied a large bow of old gold ribbon.

The exhibition closed with an auction sale, some of the plants bringing enormous prices. One plant of Mrs. Aphileus Hardy, in 8-inch pot, donated to the society by Frank Huntsman, brought \$10.

The judges were J. M. Jordan, St. Louis, Edwin Lonsdale, Chestnut Hill, Philadelphia, and J. M. Gasser, of Cleveland, Ohio.

Frank Huntsman has engaged the services of a private policeman to watch that vase and silver cup in his case on the sidewalk.

R. Witterstaetter has his list of varieties of chrysanthemums that he is going to grow for next fall already made out.

Following is the list of awards:

Mabley & Carew premium, \$100 in gold, for best collection of 25 plants, not less than 15 varieties, 1st \$50, Frank Huntsman; 2d \$30, R. Witterstaetter; 3d \$20, F. S. Walz.

Jno. Church & Co., premium, \$50 cash, best 10 yellows, not less than 5 varieties, 1st \$25, Frank Huntsman; 2d \$15, Fred. S. Walz.

Best single specimen yellow, 1st \$6, R. Witterstaetter; 2d \$4, Frank Huntsman.

Gibson House premium, \$50 cash, best 10 pink, not less than 5 varieties, 1st \$25, Frank Huntsman; 2d \$15, Fred. S. Walz.

Best single specimen pink, 1st \$6, Frank Huntsman; 2d \$4, R. Witterstaetter.

Adams Express Co. premium, \$50 cash, best 10 white, not less than 5 varieties, 1st \$25, Frank Huntsman; 2d \$15, R. Witterstaetter.

Best single specimen white, 1st \$6, Frank Huntsman; 2d \$4, R. Witterstaetter.

Sam C. Cox & Co. premium \$50 cash, best 6 new varieties 1888, 1st \$25, Frank Huntsman; 2d \$15, R. Witterstaetter; 3d \$10, Jno. Fries.

C. L. Mitchell premium, \$100 cash, best 36 plants, not less than 20 varieties, Frank Huntsman.

E. G. Hill & Co. premium, \$25 cash, best 12 varieties, American origin, 1889, Frank Huntsman.

Seedlings, judges decided they were not worthy of premiums, and would like to have them try another year.

Standards, 30 inches and over, 1st \$20, R. Witterstaetter; 2d \$15, Fred. S. Walz; 3d, no entry.

Best single specimen, 1st \$10, R. Witterstaetter; 2d \$5, Fred. S. Walz.

Harm's Palais Royal premium, handsome vase, value \$40, best 6 standards, 6 varieties, not less than 20 inches, Frank Huntsman.

Cut blooms of chrysanthemums, best 100 blooms, not less than 20 varieties, 1st \$50, J. A. Peterson; 2d \$30, A. Sunderbruch & Son; 3d \$20, Robert J. Murphy.

Begonias, best 12 plants, Rex varieties, 1st \$10, Corbett & Wilson; 2d \$5, A. Sunderbruch & Son.

Roses, cut blooms, best 12 American Beauties, 1st \$10, C. L. Mitchell; 2d \$6, Frank Huntsman.

Best 12 Marchal Niels, 1st \$6, Fred S. Walz; 2d \$4, B. P. Critchell & Co.

Best 12 Cornelia Cooks, 1st \$5, Fred S. Walz.

Best 12 Brides, 1st \$5, Frank Huntsman; 2d \$3, C. L. Mitchell.

Best 12 La France, 1st \$5, A. Sunderbruch & Son; 2d \$3, C. L. Mitchell.

Best 12 Catherine Mermets, 1st \$5, J. W. McFadden; 2d \$3, C. L. Mitchell.

Best 12 Bennetts, 1st \$5, C. L. Mitchell; 2d \$3, Frank Huntsman.

Best 12 Papa Gontiers, 1st \$4, C. L. Mitchell; 2d \$2, J. W. McFadden.

Best 12 Perle des Jardins, 1st \$4, C. L. Mitchell; 2d \$2, Frank Huntsman.

Best 12 Niphetos, 1st \$4, J. W. McFadden; 2d \$2, Frank Huntsman.

Best vase 25 blooms, newest varieties, 1st \$15, B. P. Critchell & Co.; 2d \$10, Frank Huntsman.

Best bridal bouquet, not over 15 inches in diameter, 1st \$10, Frank Huntsman; 2d \$6, Cincinnati Floral Co.

Best hand bouquet, not over 15 inches in diameter, 1st \$10, Frank Huntsman; 2d \$6, Cincinnati Floral Co.

Best 6 corsage bouquets, 1st \$10, Frank Huntsman; 2d \$6, Thos. W. Hardesty.

Best piece of artistic floral work, appropriate either for a dinner, ball, reception or wedding and not to be over 30 inches in any dimension, 1st \$25, B. P. Critchell & Co.; 2d \$15, Frank Huntsman.

Best flat basket, not over 18 inches, 1st \$10, Frank Huntsman; 2d \$6, A. Sunderbruch & Son.

Best handle basket, not over 30 inches high or 18 inches long, 1st \$10, Frank Huntsman; 2d \$6, A. Sunderbruch & Son.

Best vase basket, not over 24 inches high or 12 inches in diameter, 1st \$10, A. Sunderbruch & Son; 2d \$6, Frank Huntsman.

Best C. H. & D. monogram, 1st \$50, A. Sunderbruch & Son; 2d \$25, B. P. Critchell & Co.

Best 15-inch wreath, 1st \$6, Frank Huntsman; 2d \$4, A. Sunderbruch & Son.

Best 24-inch cross, 1st \$6, Frank Huntsman; 2d \$4, A. Sunderbruch & Son.

Best 26-inch anchor, 1st \$8, Frank Huntsman; 2d \$5, A. Sunderbruch & Son.

Best 24-inch pillow, 1st \$10, Cincinnati Floral Co.; 2d \$6, A. Sunderbruch & Son.

Frank Huntsman taking the largest number of first premiums was awarded the DuRme & Co. sweepstake premium, a silver cup. N.

Chrysanthemum Ada Spaulding.

Our illustration shows a vase of blooms of this chrysanthemum which has recently attracted so much attention and which has received so many distinctions at this year's exhibitions. Among the prizes taken was the Harrison cup in which this variety was successful over seventeen competitors as the best undisseminated seedling of American origin.

The flowers are large, soft pink on the outer petals crowning to white. The pink has very little of the lilac tinge seen in so many chrysanthemums. Our illustration shows the form and character of the flower distinctly, being made direct from a photograph.

Nomenclature.

The criticism written by Mr. Taplin concerning the article upon nomenclature may be necessary, yet it is possible that the purpose of that article has been overlooked by him. Perhaps if it should be read again the critic will notice that the article admits the failure of the "committee upon nomenclature." That the committee had not accomplished anything to speak of.

This admission was made in good faith, hoping that some good would result from the confession of failure. It was not supposed that any one would imagine that the writer was asking for information concerning the work of the committee, for he distinctly admits the inefficiency of past attempts. But though this is so, no member of the committee is ready to acknowledge that the fault, or failure, is owing to lack of desire or effort on their part.

Members of the committee upon nomenclature are in no condition to assume detective work. When that committee was appointed the invitation was general for all to communicate with the chairman of the sub-committees and speak as to any facts in their possession concerning false nomenclature, fraudulent or otherwise. But according to the writer's knowledge there has not been one re-

VASE OF CHRYSANTHEMUM ADA SPAULDING.

sponse. General inuendoes accomplish nothing. What is needed are facts; facts upon which some action can be taken.

Mr. Taplin instances one case of fraudulent nomenclature. Why did he not impart the facts to the committee? Just such cases that the members wished to obtain knowledge of. As for one member praising an individual guilty of fraud, the favorable notice must have been given in ignorance of anything to the contrary. The committee was in earnest in its wishes to ferret out knavery and sift the false nomenclature from the true.

But the work is beyond them. Unsupported and unaided they are powerless to effect any permanent result. The question still remains where it was. Still open for discussion. Still waiting a practical solution. The pages of the *FLORIST* are open for suggestions and facts.

In order that some good might be ac-

complished, and to prevent the cessation of this agitation, it was suggested by the writer that the National Society, by the consent of all, be the authority upon nomenclature for this country. There was no inquiry as to who made Prof. Reichenbach an authority, but who made him the authority. We are all aware that it was by common consent because of his learning and investigations. But why should it be thought necessary that the florists of this country should be obliged to defer to some European authority the vexed questions of nomenclature that trouble us here. If it is a fact that we have no men here able to decide these questions for us, then all the more reason that a higher scientific education for all who are desirous of availing themselves of it, should be the thought of the progressive men of the day. Let us make the society the authority for this

country. Surely the society can find among its members a sufficient number fully competent to decide all questions upon nomenclature. As it is now there is no system. There is no authority to which we can appeal. And it is to plead for an American authority for Americans that these suggestions are made.

As regards the word "Scabiosa," the writer was not in ignorance of its derivation. It was this he was speaking of, and not the meaning of the word itself. Brought forward merely as an illustration of the want of euphony in much of our nomenclature, and of the hap hazard way in which plants are sometimes named.

Upon this subject discussion is invited, but controversy is deprecated. Neither can personalities be of any advantage. The question is a vital one and should concern us all. If we fail in one direction

it may not be our fate to do so in another. If there was need to broach this subject there is need to continue it. Palm nomenclature, according to some of the gentlemen who devote their attention more particularly to the cultivation of these plants, is in a very mixed condition. It must be time that these matters should be straightened out, and who can do it better than a committee appointed by the National Society, invested with its authority, supported by its influence and reimbursed from its funds for the labor and expense involved? Let the old committee by all means be discharged, or give it more extended support. A subject for the consideration of the executive committee at their next meeting.

A. E. WHITTLE.

Education Wanted.

We read with great interest and with the expectation of learning how and where to begin to acquire an education that will help those who have not been fortunate enough to get one before or while serving their apprenticeship. I have scarcely done any other work than that in the garden, and have had plenty of practice pertaining thereto; from the labor that requires most all muscle and very little brain to the more careful and delicate work of the full fledged cultivator among his exotic pets, and finally arrived at the long coveted position of gardener on a private place.

But all this practice does not satisfy, nor answer all purposes. There are some things our experience will not give us. And now we have reached that point that we feel in a cramped condition, as it were, not bound, and want more room. We desire to grow mentally, but what shall we read is the question. And we do not want to experiment on this vital point for fear we should take up that which would be too strong and sicken of it, and our ambitions should die. We all know it will not do to pot off a cutting into a large pot, neither will it do for one that knows nothing of botany or entomology or geology etc. to take up advanced works on these subjects.

Where shall we begin? Is there not some one interested in the great army of young florists and gardeners, that will lay out a proper course of study that will cover four years or more? For there is many a one that would gladly procure the proper books if they only knew what they were and where to get them.

Could there not be a committee chosen at the annual meeting of the S. A. F. to select the proper books and have them for sale at the office of the AMERICAN FLORIST. Or better still select a committee that can devote enough of their time to lay out a course of study to cover four or six years, and at the end of every year send out questions upon the studies for the year, and if 70 per cent can not be answered do not sanction the study of the following year's studies. Or send them examination papers for the same until they have sent in 70 per cent of the questions properly answered. To remunerate the committee for their labors and to meet other expenses connected therewith charge a small fee for membership, and a small per cent on the books sold to students. Let something be done for those that can not go to a school or college for instruction.

One and all that are interested in having the profession counted with other professions (for such it is, the word trade does not answer for its length, breadth and height), take the course of study

though he be a graduate from the college, or one that thinks he has matured himself in his own little world. The more that take hold of it the cheaper it will come, and in a degree take the place of a college course and help those who are anxious to improve their mental condition.

J. H. H.

Education.

The higher education of gardeners is a subject full of problems and suggestions. It might properly be divided into three parts, practical, theoretical and both combined. Men may regard the matter from different points, according to the early impressions they have received and the circumstances that shape their views. A man having a good practical training may be very apt to consider a scientific one of secondary importance, while others having been favored with a college education are very liable to hold themselves so superior as to make the acquirement of thorough practical experience a matter of less consideration. I think it is almost impossible to combine both the practical and theoretical training in a college establishment to such a degree as is desirable. Even if possible, the benefits could only be obtained by a comparatively small number.

Where then might properly a start be made to awaken, to encourage and foster the ambitions toward a higher state of usefulness in the rising generation of horticulturists? In the conditions and circumstances as we have them or with such as are suggested by the establishment of higher institutions? Probably with most success in the former. There are many ways open to that end.

Some men are born in all conditions of life to be leaders of their fellows in their respective vocations, men competent in themselves to rise step by step, by their own energy, to eminence. But most of us require to be led, to be guided and directed on our way, and he is fortunate indeed, who may receive in his early manhood years the counsel of a wise, judicious instructor, the guidance of men of ripe experience, not only in the line of business one may elect to follow, but also in the wider, but not less important sphere of everyday life, in the social and business relations of fellow workmen, of employer and employee. For every noble calling may aspire to be a science, horticulture certainly is, but I believe it was Carlyle who said, the greatest of sciences is good, sound, common sense.

Mr. Alfred E. Whittle in his excellent article in the FLORIST of October 15, mentions as one of the means of improving the minds of young gardeners, that employers should provide for them a suitable room, convenient and attractive, with proper reading matter. This very thing the late Mr. Buist did and certainly to his credit. This matter can not be too strongly urged upon considerate employers.

Consider how forlorn a young man may feel who has in him the desire to use his evening hours to best advantage, to spend them in profitable reading in a fairly comfortable room, when he is denied that luxury. Well, he may buy himself a candle and find a snug place in the greenhouse, or he may go to loafing with the majority, or, yes, he may find refuge in the ever-inviting saloon. That's about the rule, isn't it? True, an employer may provide for his workmen to the best of his ability and receive at times ill thanks for his efforts, but he has the means to correct that, to weed out the unruly, and will do so if he wishes to

keep men of some character, and these assuredly will in one way or another show their appreciation of his kindness.

Another suggestion may be offered. In all large trade centers there are a goodly number of employers and many more workmen. Of necessity the establishments are often widely scattered. But might not a city, for instance, Philadelphia, be divided into districts for a purpose. Might not the bright men of each district consult together and with their workmen and advise and decide to establish a class, to meet perhaps once a week at some centrally located point for a course of instruction, to put inquiries concerning the points of the same, and for exchange of opinions and experience. There are doubtless enough young men to be found eager and willing to take part therein, to pay their share toward securing such benefits. Men of eminence could undoubtedly be found at a reasonable salary to give the most valuable aid and direction to their minds. If such a class were formed, say by January, instructions and lectures given weekly on different topics, that class might anticipate with the keenest pleasure the coming of spring, to use their Sunday afternoons for botanizing excursions. Happy results should certainly follow. Has not many a young person within him good and ample, but latent capabilities, and ability to develop them by himself if once aroused, provided he can acquire the methods and principles of independent inquiry through a course of practical and theoretical instruction.

Furthermore, if such a system were once established journeymen gardeners with any ambition located in places where the formation of a class is impracticable, might obtain from time to time employment in cities favored with such opportunities and share in their benefits.

I worked once for a firm, the head of which received his education, practical and scientific, in establishments and a university respectively of the highest renown in Europe. It was proposed by a relative of mine to send me to college, but the chief would not condescend it, saying I would pull along well enough without it. This goes to show that he placed no very high estimate upon a college course. Yet how glad I should be had I had a chance to have opened to me ways and lights of investigation that have ever been closed to me.

In our profession it is given to but few to gain riches by their experience or their business sagacity, hence we should seek to gain that intrinsic worth and gratification which horticulture perhaps more than most other occupations of life offers to its devoted students.

Villa Nova, Pa. JNO. W. MERTZ.

Experimental Greenhouses.

At the Buffalo meeting of the Society of American Florists considerable interest was manifested in the essay by John Thorpe on "The Establishment of an Experimental Garden," and a committee was appointed to obtain an appropriation from Congress for the establishment and maintenance of one.

Even if success crowns their efforts a considerable time must elapse before any results can be obtained from it, and in certain lines, as was suggested by our Mr. Knapper, the experiment stations now existing in the various states can render assistance, many of them having in fact begun work in several of the lines mentioned by the essayist.

The work that can be expected of them however, will be comparatively slight, as

VIEW IN THE STORE OF J. H. SMALL & SONS, WASHINGTON D. C., ON THE
OCCASION OF THEIR RECENT EXHIBITION

the \$15,000 per year received by each station is divided among five, six, or more departments, and as being of more general interest the horticulturist is expected to devote most of his attention to the fruits and vegetables.

The horticultural department of the experiment station of this state is as well equipped for work in this line as any in the country, and the experiments now under way not only include the lines of work mentioned by Mr. Thorpe, but extend to others that will, we believe, be of equal or greater value to florists.

We have just completed two green-houses for experimental work, and hope to use them to the advantage not only of the florists but of horticulturists in general. The houses themselves are designed to be more or less experimental, furnishing among other things means of testing steam against hot water heating, overhead against under bench piping, various methods of ventilation, ventilating machines, glazing and glazing materials etc. In their construction the leading methods and machines have been used and the houses are nearly ready for trial.

If any florist to whose eye this may come has or knows of any method, machine or appliance that he deems worthy of trial we will gladly arrange for it in competition with the others. We shall be pleased also to receive for trial any new species or varieties of plants and if we can in any way supply the wants expressed by the committees of the S. A. F. on nomenclature and boilers, such assistance will be gladly accorded.

These houses are heated one with a steam and the other with a hot water heater, manufactured by one of the leading firms in the country, and we shall soon commence a comparative test of the two. At the expiration of this test we shall be pleased to run either of them against those of any other firm.

My principal object in writing at this time is to call the attention of the advocates of each of the systems (steam and hot water) to the arrangement of the

pipes and the amount of radiating surface in each house, and to ask them to express through the columns of the *FLORIST*, or to me personally through the mail, their opinion as to the fairness of the test as now arranged.

The houses are span roof, each 50x18 feet inside with about 1,100 square feet of glass exposed. The side walls are of wood and extend two feet above ground. They are built in as tight and warm a manner as possible, a section being as follows, from the outside: block siding, heavy paper, sheathing, six inch airspace, paper and ceiling; the roof is of 2½x1½ inch sash bars, with double strength 10x12 glass laid with the ten inch sides on the sash bars and is as tight as can be made.

The houses extend north and south, and as our cold winds are from the southwest the west house heated with hot water is most exposed. The force of the wind, however, is broken by other buildings and large evergreens, so that the difference from exposure will be very slight. The steam boiler is exactly like the water heater, each having a magazine and 70 feet of heating surface.

The steam house is heated by 400 lineal feet of one and one half inch pipe. They are arranged with two mains over the middle bench and with six return pipes, two under each of the benches. The pipes are properly supplied with valves and vents. They have a slight fall throughout their length and at the lowest point are two feet above the waterline in the boiler.

The hot water house has the same amount of one and one half inch pipe in the same positions as in the steam house, and in addition has a two inch pipe on each side, the arrangement being as follows: On each side of the house a two inch flow pipe on the legs of the bench next the walk, and two one and one half inch returns under the bench. In the center are two one and one half inch flow pipes over the bench, and each of them has a return pipe of the same size under the bench.

The radiating surface of the pipes in the steam house equals 200 square feet, and in the hot water house 275 square feet. The boilers have been fired up and work perfectly, the pipes in both houses warming very evenly.

Before entering on a thorough test of the two systems I shall be pleased to have the opinion of such of the readers of the *FLORIST* as have had experience with both methods, regarding the fairness of a test as now arranged, together with any suggestions as to changes in arrangement or amount of pipe as will in their opinion be necessary to secure a fair trial.

Agricultural College P. O., Mich.

Trade Exhibitions.

The plan some florists have adopted of having occasional "openings" or free exhibitions of plants and flowers at their stores on occasions when flowers are in good supply can not be too highly commended, provided of course that the exhibition is a creditable one, and as a suggestion in this direction we give herewith an illustration from a photograph of the interior of the store of J. H. Small & Sons, Washington, D. C., on the occasion of a recent trade exhibition of this character.

Nearly every plant may be identified in the engraving, hence any description is unnecessary. Of course this exhibition was given in the chrysanthemum season—about the middle of last month.

Exhibitions of this kind are of great value as they unquestionably stimulate an interest in flowers and are undoubtedly worth many times the trouble and expense as advertisements of their business to those making them. While all have not the advantage of such a large and handsome store as Messrs. Small & Sons, the same idea can be utilized by all and be made proportionately valuable to them.

Gladioluses.

"November here (in New Zealand) corresponds to May in England," is the headline of the Garden Department of the *Otago Witness* just to hand. And this has suggested to me something about gladioluses. The great mass of hybrid forced gladioluses appear in late winter and towards spring and never at Christmas, and a good deal of this is owing to the fact that old bulbs won't keep over well till September or October, and summer-grown bulbs won't be ripened and rested enough to start kindly and vigorously into fresh growth if planted in early fall. Now, why couldn't the good people of New Zealand come to the rescue and pour in upon us any amount of thoroughly well ripened bulbs in summer? Of course there would be many drawbacks—the long voyage, crossing the tropics, heavy freight, duties and other expense, and after all selling them for most nothing. But it's worth trying. W. F.

Deciduous Azaleas.

We had an importation of new, hardy, hybrid azaleas a few weeks ago, and the plants were nice and stocky, well rooted and well budded, but as a good many had mollis blood in them I thought the middle of November was a little too late to plant them out and trust them to the tender mercies of a searing winter, so I potted them and plunged the pots in the ground in a deep cold-frame. After letting them stay there for a couple of months I will bring them in and let them

bloom in the greenhouse, and then plant them out about the first of next May. Flowers are not as abundant in February and March as they are in May and every little helps.

W. F.

Long Island.

Seasonable Notes.

Although so much has been written and said about the injuries to plants in flower resulting from the burning of tobacco in greenhouses, still the cry is frequently heard: What can be the matter with my roses? the buds are all coming deformed and the light ones, such as Niphetos, Bride, etc., are brown instead of white, particularly the petals next to the outside row. To all having such I would advise discontinuing fumigating and apply Mr. Palmer's method as described in the September 1 issue of *AM. FLORIST*, or if that be impracticable then use the stems on the walk, or under the benches on the pipes, or any other suitable place; but do not place them on the soil in which the plants are growing as it will certainly injure the plants to do so. Formerly we could burn the stems in the greenhouses, if careful, without any injury to plants or flowers, but not so now. The same adulteration (principally salt petre) used in manufacturing the tobacco will injure alike, whether laying on the soil or burned in the houses. Can not some enterprising manufacturer get up a cheap way of making tobacco juice so that it can be evaporated in the same way it is done in France and England? It would soon commend itself to the trade throughout the country, as there would then be no need of having a lot of untidy looking stems laying round the houses. Besides, its economy must be something considerable for large places.

Now that we are having really dark wintry days every care should be taken to utilize what sun light we do get. This is of utmost importance in keeping the plants healthy, particularly in the eastern states where we have had so much cloudy weather the whole season through. Our western brethren I hope have fared better in this respect. With so much moisture in the air it has been almost impossible to keep clear of mildew all the fall, and now the winter is here with the wood all very soft, hence the greater reason for making the best of sun light possible. Keeping the temperature down at night will help somewhat, but the great point is to give all the air possible when the sun shines, without causing a draught. During such weather as we are now having extra care should be exercised in watering, as it is very easy to get the soil too wet, and should that occur the plants will receive a severe check, and the loss of root action caused thereby leaves the plants much more subject to the ravages of red spider etc. Black spot will also have the best possible chance to assert itself under such conditions. Careful watering at all seasons is one of the most important things to attend to, but especially so at this season of the year. In some varieties, such as Bennetts, the roots always have a tendency to come to the surface when the plants are growing

well, particularly in shallow benches. Where they are doing so a very thin mulching of well decomposed cow or sheep manure will greatly help the plants to produce fine buds and is much safer to apply than liquid manure, but under no circumstances should it be put on more than half an inch thick at a time.

For the proper ripening of hybrids this has been a particularly unfavorable season. For those who grow them in pots and depend upon ripening them off in the open air it has in the eastern states been almost impossible to get the wood in the proper condition. But now that frost has come the plants can be subjected to its influence for a short time and they are ready to prune and start into growth. Where really fine flowers are the desideratum they should be started in a very cool temperature so as to ensure root action at the same time with leaf action. Where they are planted in benches inside the greenhouses the sash should now be put on to prevent their getting too much water. In starting them calculation should be made as to the time the flowers are wanted. At this season it takes from 11 to 13 weeks to get them into flower, from the time of starting, varying of course somewhat according to the varieties. Jacqueminot, Magna Charta and other early varieties will take less time than Baroness Rothschild, Ulrich Brunner etc. In pruning these it is best to prune back to good solid wood and prominent eyes; all soft shoots such as have been produced late in the season should be cut away altogether, as they only produce strong wood without any buds and rob the buds on the other parts of the plants.

JOHN N. MAY.

Roses Coming Blind.

At this season of the year several varieties of tea roses such as C. Mermet, the Bride, Mme. Watteville, etc., are very apt to fail to set their buds. The principal cause of this is want of sun at a critical time during the period the new growth is being formed, but it occurs most frequently on shoots that are comparatively weak and where the temperature is kept a little too high at night and a corresponding deficiency of air during the day. Therefore to avoid getting blind shoots, as they are usually termed, keep the houses as near temperate as possible at night and give all the air reasonable by day on every favorable opportunity; keep the plants clean and healthy, which will greatly help them to produce strong vigorous growth, the best possible preventive of blind wood.

Where the soil has become bare of mulching from continued watering and syringing a very thin sprinkling of pure ground bone covered with not more than half an inch of good fine manure will now greatly help roses that are growing freely, but avoid putting a thick coat of mulching on now as it would have just the opposite effect to that desired, namely helping the crop along. Before putting the mulching on be careful to pick up all dead leaves, &c., clean them off the plants also; this is not only important at this particular season but at all times, as all decaying leaves are only harbors for insect pests and therefore should be removed regularly and burned.

Hybrid Perpetuals: Those having these and wishing to get them into bloom for Easter should now get them pruned, cleaned, etc., ready for starting. To get really fine blooms from these it will take at this season about twelve weeks to get them in bloom from time of starting. The

earlier varieties such as Jacqs, Magna Charta, Anna de Diesbach, etc., may come in a few days less, and the later varieties such as Baroness, Ulrich Brunner, etc., a few days more.

JOHN N. MAY.

Souvenir de Wootton.

Our full page illustration gives an interior view of a house of Souvenir de Wootton roses at the establishment of C. Strauss & Co., Washington, D. C. The house is 200 feet long and contains 2,600 plants, which were propagated last April and planted on the benches in four inches of soil about July 1. The photograph from which the illustration is made was taken about October 25.

The illustration also well shows the style of construction of the modern rose house built on the most approved plan.

NEW ROSES.—We should like every rose grower who has tried any of the new roses for forcing, especially Souvenir de Wootton, Duchess of Albany and Mme. Hoste, to report to us his experience with them up to date, and the opinion he has formed as to their value.

AMERICAN BEAUTY.—Is American Beauty shy in producing good flowers this year or can it be that it is so with me alone? They are doing hardly half as well as in former years with me.

Harrisburg, Pa.

J. P.

Cosmos Bipinnatus.

For the last two years or more the flowers of this pretty annual have sold exceedingly well in late summer and fall, even after the chrysanthemums were plenty in market, and they should be grown more extensively, for the demand has been so far much greater than the supply. The seeds may be sown under glass in the house in boxes or in a hothed in early spring not later than May first, and then planted out after danger of any frost is past. They should be allowed plenty of room, at least two feet each way or more if there is land enough to spare; they will grow from four to five feet high and will make a well branched bushy plant without any trimming or pinching. The first flowers will show about the beginning of September under favorable management and will keep on flowering until frost puts an end to them. The flowers are single, daisy-like, with a yellow disk; various shades are represented from pure white to a dark shade of pink and even a rosy crimson, and last a very long time after being cut.

In our northern climate early frosts will destroy them sometimes even before they reach perfection and we can not expect a full crop of flowers if the plants are left outside. For this reason I have been experimenting a little, growing a quantity of the plants in 8-inch pots over summer and planting them in a center bed of a house the latter part of September. At the same time we dug up a number of them from outside and planted them side by side with the others. There is no serious difficulty in lifting them, for they make such a mass of fine roots that generally a good large ball will come up with the plant and if watered well after they are replanted, even shading will not be required unless the weather should be exceptionally hot and dry. There was no marked difference between both lots, size and abundance of flowers being the same; the pot plants kept on flowering a few weeks longer than the majority of the lifted plants, but considering the labor

VIEW OF A HOUSE OF SOUVENIR DE WOOTTON ROSES AT C. STRAUSS & CO.'S, WASHINGTON, D. C.

caused in potting and caring for the others over summer there was not enough difference to warrant a continuation of this plan and the lifted plants paid best in the end. I planted them in a bed which was intended for potted callas over winter and when we had to take those under cover we set them a little closer together than usual until the cosmos would be out of the way, so in reality I did not prepare or keep a place specially for the cosmos and therefore can not count the house room they occupied as an additional expense. It will not cost much to grow a good supply of them if you can only manage to give them house room for a few months.

Rochester, N. Y. JOHN B. KELLER.

Sphagnum for Plants.

There are several advantages in favor of moss over the common potting soil for growing begonias, geraniums, callas, Dutch bulbs, etc. The moss retains moisture longer than does the soil and it will not sour as readily, and during the hot weather plants growing in moss will stand several degrees more heat than those grown in earth. There may not be any great saving from the time the cuttings are struck till the plants are disposed of, still they can be grown as cheaply in sphagnum as in earth and they will give better satisfaction to the buyers as the express charges will be less and the plants look cleaner, and they can be prepared for shipment with less labor and arrive at their destination in better condition than plants grown in earth.

I am now growing callas, begonias, Dutch bulbs and other plants in sphagnum and they look as fine as, if not better, than those grown in soil. I would like to know the views of our more practical florists on this subject.

Savannah, Ga.

H. N. JONES.

[There is nothing new in growing potted plants in sphagnum moss. About nine or ten years ago a great effort was made to introduce Dumesnil's Moss—a "preparation of common moss by some chemical solution, so as to enable it to support plants wholly without the aid of soil," and it had a fair trial, but we hear very little of it now-a-days. And fertilized moss, that is moss mixed with bone meal has been extensively used as a mulching for pot plants, and a capital thing it is too to help plants that are starving in small pots and when it is not desirable to give them a largeshift. But that sphagnum moss alone is better than or as good as soil for use in potting the vast multitude of plants handled by commercial florists, is pretty forcibly answered by its rejection.]

The Marguerite Maggot.

Having had some trouble with the worm that penetrates and feeds in the leaves of the *Chrysanthemum frutescens* or Marguerite, the *Cincaria hybrida* and some other plants, I took some infected leaves of the former and placed them in a jar to await developments. In the course of a few days there appeared a number of small flies, very similar in general aspect to our common house fly, except in size, which was smaller. I then injected some tobacco smoke into the jar and the result was that they all dropped at once to the bottom apparently killed. An examination the next day proved all to be dead.

I would recommend to any one who has had trouble with the pest, in the future to fumigate at least weekly for a couple of months such plants as are liable to the attack of the insects as soon as the

plants are housed. For any one who has trouble now with the ravages of the worm I would advise carefully picking off all the infected leaves once a week for three or four weeks, and fumigate twice a week until the pest has disappeared, which should not take more than a month, but depending greatly on the amount of heat and sunshine present, which will hasten or retard the transformation of the maggot to the fly, in which state it should be destroyed before it can lay its eggs.

The treatment of an infected plant such as dusting with tobacco dust, paris green etc., to kill the worm has as far as I am informed always met with failure. Probably because it does not come in contact with the food consumed by the insect.

P. M., Jr.

Handling the Young Plants.

A very important feature in growing carnations from cuttings is to have them well rooted before disturbing them in the sand; in this respect they differ from many other plants. Verbenas for instance, are the better for being handled and potted off as soon as they show the first signs of roots, and the same may be said of many other soft wooded plants, but my experience is that carnations are an exception to the rule, for I have often noticed that the well rooted carnation cuttings when potted or boxed off will go right ahead and make at once strong vigorous plants, while those with very small roots, even if quite healthy, seem to take a long time to start, and quite often if potted off too soon the young plant seems to become hard around the base. This is particularly liable to be the case with Buttercup and other heavy wooded sorts. I should much like to hear the experience of other growers in this particular, as there seems to be considerable difference among varieties in this respect.

When well rooted and the operation of boxing or potting off is commenced, it may be said that we have fairly started out for another year's experience, consequently it is important that we endeavor to start right and so treat every young plant that it will fulfill its mission by paying for itself in the end.

Every young plant whether it is placed in a pot or in a box should be planted deep enough and firm enough to enable it to maintain a perpendicular position throughout the season, and if this is attended to at the first start it will not be difficult to carry out the plan at planting out time. The sketches which accompany this will explain my meaning better than any words I can write. It will be noticed that No. 1 represents a young plant put firmly in the ground, and deep enough to be safe from disturbing winds or any other influence which might affect its stability during its season's growth. Such a plant will go right along without stopping; all we have to do is to keep the conditions right for its growth, draw the centers out of its leading shoots when necessary, and when lifting time comes we have a plant worth looking at. With No. 2, however, the reverse is the case; that shows a young plant which has been carelessly potted in the first place,

and when planted outside it was planted so near the surface that the first puff of wind that came sent it over to one side, or as a seaman would say gave it a hunch to leeward, ready for a wind from the opposite direction to send it back again, and so on whiffing it back and forth throughout the summer, first from one side then the other. Under such circumstances we can scarcely expect a plant to amount to very much, yet it has cost just as much capital to bring it to planting out time as the other one which makes such a very different showing.

Growers who have had the misfortune to be obliged to entrust such matters to careless help will readily catch on to this idea. Not only is a carelessly planted carnation liable to be greatly retarded by the winds of summer, but a thousand accidents are liable to happen to such a plant, which one that sets perpendicularly and is well planted deep enough in the ground is quite safe from, besides a plant lolling over on the ground at an angle is pretty sure to have its stem so roasted by summer heat as to be of but little value any way.

In boxing off young carnations I have sometimes found it advisable to divide them into two or even three sizes, putting those of equal strength by themselves in one box; by this means if the weaker ones need a little different treatment towards spring it can be given them without interfering with those already of sufficient strength. Also for the same reasons it is often best to pot varieties of fine growth at once into thumb pots. Grace Wilders that I grow for my own flowering are always so treated, and I am convinced that the extra care and space is well paid for by the increased strength of the plants.

Where the young plants show the necessary size and strength it is a good plan to draw the center from each as they are potted or placed in the box, the rooting and the preparation for new growth then takes place simultaneously, the smaller ones can be treated in the same way as soon as they have attained sufficient size. Carnations, especially young healthy stock, seem to delight in a low temperature, and if after being potted or boxed we can keep them at 40° or 45° they will grow faster and make stronger and better plants than in any higher temperature. I have come to this conclusion after many years experience and careful observation.

I find by reference to the greenhouse journal that my young carnations during the last four years have been potted or boxed between the middle and last of January, and for the same period they have been turned from the houses to the cold frame from the 8th to the 20th of March, except of course in cases where new varieties or special treatment to small quantities was concerned.

It often happens here that we have very cold weather after the middle of March and especially keen cold cutting winds, but we also have some fine days with bright strong sunshine, and if we can only get the young stock out and protected during the nights and perhaps a few of the coldest days during the balance of March, the trouble is all over and we get the much needed room inside for other purposes.

H. E. CURTIS.

Paterson, N. J., Nov. 21.

A New Pest.

Mr. Andrew Washburn, of Bloomington, Ill., appears to have been visited by an insect pest which I fear has been more or less common among carnations this season.

Fig. 1.

Fig. 2.

HANDLING YOUNG CARNATION PLANTS.

The first intimation that I had of its presence was a few days after my carnations were housed, when my foreman noticed something wrong with the Grace Wilders; the extreme tips of the shoots in many cases appeared to have been singed and would finally droop down and wither away. We then noticed that many of the largest buds seemed to have been punctured by an insect, and pretty soon thereafter we found a large number of slim worms about half an inch in length and perhaps a sixteenth of an inch thick, of a green cast with light yellow stripes lengthwise of the body. They appeared to be as happy as clams and doing well, but we made short work of them by hand picking. They were living so high that they increased in size very rapidly, but in ten days after we got the first proof of their existence we had them annihilated, but even in that short space some of them had attained an inch and a half in length, and their appetites seem to have been so perfect that I have no doubt they would have made a clean sweep of everything in the carnation line had they been left undisturbed for only a short time longer. As it was the Grace Wilders were the only plants touched.

I have no knowledge of the name or habits of this pest only so far as noted above, but presume that the perfect insect deposited its eggs in the carnation buds while the plants were still in the open ground, and being hatched about the same time the plants were housed they soon eat their way out and were ready to attack the plants.

Judging from Mr. Washburn's description, his experience agrees with mine, and I fear that we have a new and very serious difficulty to contend with in carnation culture, and those who have fortunately escaped the pest this season will do well to be on the alert next year.

H. E. CHITTY.

Burned Sods.

As stated by Mr. Whittle in November 1 issue, burned sods from heavy soil is a very desirable addition to soil not so treated, and in the interest of a "scientific education for florists" we wrote to Mr. Peter Collier, director of the New York

Experiment Station, at Geneva, N. Y., asking if he could not enlighten us as to the chemical changes caused by the burning, and which in all probability liberates, changes and renders available food which could not before be assimilated by plants.

We give his reply below, as while it does not answer the question it is still of considerable interest:

"The matter to which you call my attention is one of very great interest. I remember in 1873, when as one of the Commissioners to attend the World's Exhibition at Vienna, I was invited to visit the estate of Prince Schwartzburg, lying between Wittingan and Budweis in Bohemia, I was greatly interested in seeing a field which had long lain under pasture being broken up for cultivation. The turf was stacked up in heaps four or five feet high and three feet in diameter with a center of sticks and roots which being kindled the entire mass was reduced to a pile of earth and ashes. I was assured that this treatment had been continued with most satisfactory results from time immemorial, and although there was obviously a great loss of nitrogenous matter the improvement of the soil by this burning of the sods was manifested in increasing its friability and rendering it far less tenacious under cultivation than it was found to be without such treatment. I can not learn that the matter has been investigated, but in certain portions of the old country it has been extensively practiced. I can not therefore really answer accurately the interesting question you propound, but can not but believe that this information will prove of interest to you and may be new."

Notes from Oyster Bay.

BY WM. FAUCONER.

The other day I rode over to Oyster Bay—the prettiest bay on the north shore of Long Island—about seven miles from here, to see my friend W. L. Swan. He called him Commodore Swan. He is a member of the New York bar, but, years ago he retired from practice and devoted himself to rural life. The cultivation of flowers has always been a passion with him, and his pretty little garden and gay greenhouse have for long been one of the

beauty spots of Oyster Bay. Urged by his many friends and neighbors, as there was no other commercial florist in the village, he, a year ago, entered directly into the florist business, and has confined himself mostly to local trade. He has added largely to his greenhouse accommodations and his collection of plants, and he tells me his encouragement fully merits this expense. Oyster Bay is a quiet little village surrounded by beautiful kalmia-lined hills, and studded all about with the summer homes of some of New York's richest people, and the railroad only reached here this summer.

Well, what does Mr. Swan do? He goes ahead and gets up a stock of the very best popular plants he can get together, just such plants as he thinks will suit the people hereabout, and he grows them well and displays them where and how they will look the best. The people don't know what they want till they see it, but as soon as they see something that is real pretty, then they know they want that plant and they buy it. And it often happens that when they see some lovely plants they yearn for them and would buy them if they only knew what to do with them after they got them; now, don't worry your customers in this way, if you tell them they may forget it, but if you show them how you use these plants, that they cannot forget. A case in point: Mr. Swan had a lot of fancy-leaved caladiums and begonias and he planted a bank of them up against the north front of his dwelling house, with tall flowering begonias and ferns against the railing which was also run over with vines and the pillars draped with vines, and selaginellas interspersed for effect's sake. The combination was so pleasing to some of his customers that they straightway determined they wanted just such an arrangement of plants at home, and now Mr. S. has not got caladiums enough to fill his orders already booked for next spring. If he merely grew a stock of caladiums in his greenhouse the demand for them would be limited, because, while all might admit the beauty of the plants, they would not invest deeply in anything they would have to take perpetual care of in a flower pot.

Mr. Swan has another attraction for the people: His place is on one of the principal streets, and it is a point with him to make as becoming a display of flowers around his house and towards the street as possible; and the beds and borders that teemed with showy plants in summer are now filled with bulbs for an array in spring. This establishes his pre-eminence in his business in the community, attracts the admiration of every passer by and sets them all a-talking and spreading his good name, prompts the interested to "come in," and starts a spirit of emulation among the people.

Furthermore, neatness and cleanliness are everywhere apparent, no lady is afraid to enter lest she may bump her head against the ventilating pipe, soil her shoes upon the mud-beddled passageways, or strain her dress by rubbing it against the shiny algae-painted bench-posts or pots. A kindly greeting is extended unto every one. And as is the case with every intellectual, educated man whose plants and flowers are seated just as deeply in his heart as in his pocket, he knows his plants from first to last and can answer every point about them, and his love for his plants at once becomes apparent to the customer who is straightway inspired with confidence in the florist.

Now Mr. Swan is only doing here what

any other florist in any other village can do and should do. Be progressive, get up and do something and do it well and show it to the people. Don't wait for the people to come to you, go you to the people.

Dendrobium Nobile.

Although all growers feel more or less familiar with this valuable old orchid, it is doubtful if one half of those attempting to grow it know how to do so in a way that will realize the best results.

D. nobile is naturally what might properly be termed a spring blooming orchid, and as frequently grown, comes in flower after the winter demand for choice flowers is to a great extent past. One point of importance is to get them into growth as soon after blooming as possible, or to begin with, start the plants into growth without regard to bloom if only a light crop is anticipated, the great object being to give them the benefit of the hot sunny weather of the spring and early summer months, so as to complete their shoots early, thereby giving them a longer period during which to fully ripen the canes. This is best accomplished by removing the plants to a cool airy house, such as a carnation or chrysanthemum house, or garapery if past fruiting, which will necessitate less frequent waterings, thus lessening the risk of starting the buds at the base of the pseudo-bulbs before the blooming season. The plants should be given all the sun which the position affords, full exposure to the sun will not injure them during the fall months, at the end of which period the buds will show at the nodes and the shoots will be of an amber color. By this method the foliage is retained, which adds much to the beauty of the plant while in bloom.

In writing the above I am not unmindful of the fact that many old orchid growers tell us that *D. nobile* flowers only from the growth of the previous year, which must be much weakened by having made a successive growth before blooming, or the vigor of this growth must be lessened by having been retarded, all of which account for the indifferent success attained by many who attempt to cultivate this orchid.

The plants may be grown in pots nearly filled with rocks and charcoal and topped with moss and fern roots, or in baskets with lumps of charcoal and sphagnum and suspended from the roof, but in either case a liberal supply of water is needed during the growing season, two or three syringings daily being not too much, until the leaf at the tip of the shoot is developed when water should be gradually withheld, allowing just enough to keep the shoots plump during the season of rest. When the buds are well advanced the plants may be brought into a warmer house, a few at a time for succession, and more water given.

BENJ. GREY.

Caterpillars and Cockroaches.

In a recent issue of the *FLORIST* Mr. Whittle tells us of his success in using "Slug Shot" in keeping caterpillars from his mignonette. We also were troubled a good deal with these pests this season

and after several ineffectual attempts to get rid of them by picking, we tried a solution of paris green applied with a syringe and were much gratified to find it a complete success, the caterpillars dropping off dead in a few hours, one application being found sufficient.

Some years since our orchid houses were overrun with roaches, resulting in much damage to the plants. After trying many unsuccessful methods of extermination we at last hit on "Costar's Rat Exterminator," which proved so efficacious that in a few weeks not a live roach was to be seen, and we have not been troubled since, but every few months we use a few boxes as a preventive. These pests are often imported with orchids, especially when received direct from their native habitat. In mixing the poison we use one part poison and two parts molasses, putting about one half a teaspoonful on pieces of tin, oyster shell, etc., and place in warm dry corners of the house, replacing every two days. F. GOLDRING.

Greenhouse Work.

The work now in hand at Lincoln Park greenhouses, Chicago, is: Propagating *Alternanthera amena*, *aurca nana* and *latifolia* from stock plants. A. *versicolor* and *paronychioides major* are propagated in August, as they then make stronger plants to carry over, which is not necessary with the kinds now being propagated.

Varieties of *achyranthes*, *pilans*, common feverfew and *chrysanthemums*, and *Thymus argentea* and *Mt. of Snow* geraniums are now being propagated. *Coleus* which were propagated September 1 are now being shifted into 3-inch pots. A varied stock of bedding plants, propagated in the latter part of September are being grown on for stock to propagate from in March.

During Christmas week they will sow seeds of *Cineraria maritima*, pansies and *Verbena hybrida*, and January 15 seed of *Ten weeks* stocks will be sown.

Gardenias.

Replying to W. J. B., gardenias that are in a stunted and sickly condition are not worth recruiting; better start afresh and with a vigorous lot of young plants. Gardenias are easily raised from healthy cuttings. These should be grown in porous soil and well drained pots, kept moderately warm and rigidly clean, and syringed once or twice a day; they should also be kept near the glass, and pinched when necessary to make them bushy. After completing their growth they like a little rest, but as they are evergreen they must never be kept very dry at the root.

Hot Water in 2-inch Pipes.

As to the merits of heating greenhouses with steam or with hot water, I do not wish to discuss, as both have their advantages, but to those about to put in hot water, let me say don't use 4-inch cast pipe when you can secure 2-inch wrought iron pipe. After having several years experience with both, I would never put in any more 4-inch cast pipe. With 2-inch wrought iron pipe you get much nearer the advantages claimed from the use of steam, that is they heat up very much quicker, also very much hotter, throwing off their heat more rapidly, and in the morning when the sun comes up to warm the houses, they cool down much quicker.

At first thought many would say that you would need double the number of 2-inch pipes to take the place of 4-inch pipes

but this is not the fact in practice. I would say from my experience that one thousand feet of 2-inch wrought iron pipe with the same fire will do as much heating as the same quantity of 4-inch cast pipe. With 2-inch pipe the water becomes very much hotter and the circulation more rapid, in fact very soon after your fire is started, your houses begin to warm up and will be quite warm before you would get any effect from the 4-inch pipe. Another great advantage is in the cost of the pipe and the great ease with which you can pipe a house, either with overhead or under the bench system. I for one like them combined. A fair trial of heating a greenhouse with 2-inch wrought iron pipe I think would give satisfaction to anyone using hot water.

Hudson, N. Y.

E. HOLLEY.

Raising Hardy Plants From Seed.

BY WM. FALCONER

True species of plants like *Lilium tenuifolium* or *Coreopsis lanceolata* will come true from seed, but the seedlings of varieties of plants, say of perennial larkspur or hybrid pentstemons, may vary somewhat from their parents. The most noticeable instance of the difference in kind of seedlings of varieties from their parents, I now remember, is in the case of our common chrysanthemums—scarcely any two being alike or any one exactly resembling its mother. But when varieties have been carefully selected, isolated and perpetuated as in the case of the double white hollyhock, the variety often comes as true from seed as if it were a species. This is more noticeable in annuals, to-wit, China asters and sweet peas than in perennials.

From seed is an expeditious way in which to get up a large stock of certain kinds of hardy perennials. These include columbines, pleuris root, species of pentstemons, *liliums* of many kinds, *primroses*, *trilliums*, many bellflowers, *corcopsis*, *rudbeckias* and *baptisias*.

Not from seed, but, instead, from division or cuttings should be the rule when named varieties of plants are considered. The hardy *phloxes*, hybrid pentstemons, pinks, German irises, perennial asters, *boltonias*, *peonias*, and the like comprise this group.

When the varieties of any species, for instance *Phlox paniculata* or *Iris Kämpferi* (*lexigata*), are apt to spread into a multitude of kinds there is far less likelihood of the seedlings being the counterpart of their parents, than if only about two varieties were common to the species, for example in several species of *campanula* (blue and white), and foxglove (rose-purple and white).

Double-flowering plants do not set seed as freely as do singles, and their seedlings are scarcely ever all double, besides many of the doubles that appear among the seedlings are likely to be too inferior to be worth raising. Double feverfew and double *Pyrethrum roseum* may represent this group. On the other side, of course how many double-flowered annuals—*peonia*-flowered poppies and balsams—come invariably true from seed.

We seldom think of propagating *Veronica rupestris* from seed because of the great ease by which it is propagated from cuttings. Perennial asters too multiply greatly at the root and are propagated by division of the clumps, and *Anemone japonica* and *Clematis Davidiana* are increased by cuttings of their roots much like as we do *bouvardias* in the greenhouse, and in many such instances as these, division or cuttings being a handier and less troublesome method of propaga-

tion than seed they are the ones usually adopted.

The seeds of some perennials, *Rudbeckia purpurea* and *Lilium tenuifolium* for instance, germinate in a few days after sowing, indeed most as readily as do those of annuals, whereas the seeds of others as *Lilium auratum* and *Helleborus niger* may take months or a year to come up. I have had some *Thermopsis Caroliniana* come up from seed in a few weeks, and others of the same sowing now and again for over a year, and all from the same crop of seed saved by myself from the same plant. Clematises, anemones and others also show an unevenness in germinating.

Quick germinating seeds like those of hollyhocks and columbines may be sown in flats in a warm greenhouse if need be, but it is unsafe to sow slow-to-germinate seeds like peonias and *Lilium superbum* in heat, as they would be apt to rot.

A ready way of getting up a stock of seedlings of delphiniums, hollyhocks, pentstemons like *ovatus* and *diffusus*, sweet williams, *Coreopsis lanceolata*, Iceland poppies, irises of many kinds, and a good many others is to let the old plants ripen and scatter their seeds about them and the seedling come up there. Then we may lift the seedlings and transplant them into nursery rows, or into flats or frames, or elsewhere as we wish. And we can get over the evil of these miscellaneous seedlings being a mongrel lot by cutting off all the old flowers of the poor varieties and before they go to seed, and leaving only the choice sorts to ripen and drop their seeds. Self-sown seedlings got in this way are just as good as those raised with the tenderest care, and then what a saving it is in labor. I never dig over our herbaceous grounds in fall, chiefly for this reason. I merely cut over the old plants and clear away the tops and have the ground clean and level, then scatter a coating of rotted manure all over the surface—over plants and all—and leave it in this way till spring. In spring I can save and transplant all the self-sown seedlings I wish and fork under the balance. The amount of *coreopsis*, poppies and other annuals I save in this way is also considerable, and they come into bloom a month ahead of spring sown stock.

When a florist raises his own seed he can sow it in fall—August is the best month, but September will do—and get good plants to keep over winter and sell off in spring; but when he has to depend upon the seed store for his supply, the seeds will probably be of the previous year's crop, hence, maybe a little more tardy in growing. I always endeavor to get up my stock in fall or during the winter months and before the rush of spring propagating comes in. Fall-raised seedlings are always stout, well-rooted, hardy plants by the following spring and in good condition for shipping; on the other hand, even if spring raised stock may be large plants enough they are usually pretty poor for long distance shipping.

As soon as our seeds ripen early in fall I sow what I want of them in flats according to kind, and place these flats in shaded cold frames; the ready growing ones as polyanthes and wallflowers soon come up, but many of them as perennial phloxes, baptisias, *Lilium speciosum*, monkshood, etc. lie dormant till next spring, when they come up thick enough. Frost often assists germination. I have had lily seed sown in fall as soon as gathered come up the following spring, and more of the same seed of the same gathering which was not sown till spring not germinate till the ensuing spring.

Leaves of Advice From a Limb of the Law.

(For Young Florists.)

XL.

Good morning. No apology necessary. I was admiring that beautiful rubber plant. It is one of the sturdiest and largest I ever saw.

Who is the owner? No owner! What do you mean? Oh, there are two owners, eh? Each forbids you to deliver it to the other does he? Well, this is quite a novel point. Ownership is always an interesting study and when you get through

WILLIAM J. STEWART.

nursing that sick plant we'll talk a little about it.

There are two kinds of joint ownership, in one case the thing owned, in case there are two owners goes to the surviving owner absolutely. But in this country we don't look with much favor upon joint ownership. When a man dies in this country owning a share in any piece of property, real or personal, we like to see the interest descend to his legal representatives and not to his co-owner or owners.

The kind of joint ownership popular in this country is called a tenancy in common. For instance, these two gentlemen are owners in common of this rubber plant. In case one dies his next of kin would take his share. They each own one half, but it is an undivided half. If they can't agree as to the disposition to be made of this rubber plant, you may be obliged to invoke the assistance of the court and have it sold, your charges paid and the remainder divided between these two eccentric gentlemen. Ownership needs no consideration to support it.

A man has a right to give a thing away, provided he is solvent. True, in giving real estate it is customary to express some sort of a consideration, such as "natural love and affection and the sum of one dollar." But it is an empty form. A deed would be valid without any mention of a consideration provided it set forth the fact that the grantor desired to vest the fee in some person, and "therefore he doth by these presents give, grant, etc." The mere manual delivery of a piece of personal property carries the title to it in absence of all fraud.

But I need hardly tell you that possession is only *prima facie* evidence of ownership. Instead of being nine points in the law it is not a single point. The law

merely presumes ownership from possession. But you know "presumptions" may always be overthrown. Ownership only becomes absolute upon one proof of that fact. Even the false teeth which enables an unscrupulous man to swear that they are paid for may, upon the submission of all the evidence, turn out to belong to the dentist who merely "loaned" them to the man to try.

One kind of ownership we called a "life interest." After the death of the "life man" the property goes to the "remainder man." Now you will readily understand that the law could not with any show of justice permit a "life man" to execute a mortgage on the property for any longer time than he might live.

When personal property is dangerous the law exercises a restraint upon your ownership. For instance, it would not permit you to store gun powder or dynamite in this greenhouse. Nor would it allow you to grow poisonous plants here unless with closed gates or doors. It also watches over your cattle and beasts of burden. Your ownership doesn't permit you to be cruel to them. Naturally ownership either to real or personal property rests mainly upon "paper titles."

Business men are too apt to be careless in perfecting their ownership in the merchandise in which they deal. This can not be too strongly condemned. Therefore, I advise you to scrutinize receipts, bills of lading, bills of sale, etc. Nothing is more liable to end in errors, disputes and law suits than the custom of opening a running account and paying something "on account" now and then. Insist upon a statement before you send a check. Then you'll know where you stand.

Watch balances on both sides of the ledger. Above all, don't claim that you own a piece of property unless you do. I mean by that don't get credit on the fact of "living in your own house" when the place is mortgaged for three quarters of its value. In that case you are only the "equitable owner." In equity, a man may own a million dollars and yet not be able to pay for a plate of soup.

UNCLE BLACKSTONE.

William J. Stewart.

On this page we present a portrait of Mr. William J. Stewart the present secretary of the Society of American Florists, to which office he has been twice re-elected, and which he has most creditably filled. He is also well known to the readers of the *FLORIST* through his frequent contributions to these columns.

Mr. Stewart was one of the pioneers in the wholesale cut flower commission trade, which business he still conducts in Boston, and is so well known to the trade that an introduction is hardly necessary.

New York.

The final sale of the Wilson estate, which occurred November 25 and 26, was well attended, in spite of inclement weather. This sale included plants, nursery stock, pipes, pots and miscellaneous belongings of a nursery. Prices realized were fairly good, and the amount realized is said to be over ten thousand dollars. No settlement has yet been approached, though it probably will not be very long before the affairs are wound up.

Mr. John Henderson is still lying in a very precarious condition, being dangerously weak, and his friends feel very grave fears for his recovery. His kindly face and gentle old school courtesy are missed by his many friends in the trade.

IN ANOTHER COLUMN will be found a communication from the superintendent of the horticultural department of the Michigan Agricultural College, describing his preparations for a test of the comparative value of steam and hot water for heating greenhouses. We are pleased to note that an effort is being made to definitely settle this question, about which there has been such a diversity of opinion, and trust that the advocates of either system will not fail to supply to Superintendent Taft any information which they think will be of value to him in his efforts to make the test fair and conclusive. We are also advised that the Experiment Station at this college is prepared to make tests of flowers, fruits and vegetables, of insecticides, and of any implements and machines that are to be brought to public notice.

Now is the time to begin preparations for the fall exhibitions of 1890. Too early! you say. Not a bit of it. The usual mistake is to let the matter drag along until it is too late to have all the details properly attended to. It is not too early to prepare your premium list, for those who expect to compete will want to know now what premiums are to be offered, that they may propagate and prepare to grow the plants in accordance with the requirements of the schedule.

THE HOLIDAYS are at hand and the annual bustle of preparation is heard among the florists. The season is far from one of rest and recreation with those in the trade, but we can secure all the rest desired—generally more than desired—during Lent. We must make hay while the sun shines, and in a financial sense the sun will shine brightly for the next few weeks. We therefore wish all our readers a busy Christmas and a happy and prosperous New Year.

A. N., SAN FRANCISCO.—We were unable to identify the grubs sent which were pretty well dried up when received. Lime is recommended, but we doubt if there is any way to thoroughly clear them out except to take the soil all out and start again with clean soil. Manure frequently harbors grubs which do great damage in the greenhouse and it should be carefully inspected before being admitted. See back numbers for recommendations as to soil for roses.

SOME SPECIMENS of the Numbchoestnut received from Sam'l C. Moon, Morrisville, Pa., were of remarkably large size and of fair flavor, though hardly equal to that of the common kind. This chestnut is a fine shade tree and the size of the nuts will undoubtedly find a quick market for them, even if the flavor is not quite as rich as the smaller ones.

A copy of Tillinghast's Floral Album is sent us by Isaac F. Tillinghast, La Plume,

Pa. It contains 30 pages of colored lithographs of flowers, nine different subjects on each page.

WITH THIS ISSUE the FLORIST appears in a new dress of type which decidedly improves its appearance typographically and which will, we believe, be appreciated by our readers.

AFTER the exhibition is over is the time that we are told how it should have been managed by those who did not do a stroke of work in connection with it.

A. R. ALDRICH, Springfield, O., sends us a calla bloom with an investing leaf resembling a spathe, and with an abortive miniature flower between the two.

MR. PETER HERKE, Cleveland, O., sends us specimen flowers of a seedling single violet which is of large size and exceedingly fragrant.

FROM FRED BURKI, Bellevue, Pa., we have received a box of late chrysanthemum flowers which show evidence of good culture.

JOHN GOODE & Co., Chicago send us a box of chrysanthemum blooms of very good quality for so late in the season.

Catalogues Received.

Seven Oaks Nurseries, Bay View, Fla., tropical and semi-tropical trees and shrubs and greenhouse plants; Fred Roemer, Quedlinburg, Germany, flower seeds; John Palmer & Son, Dumfriesshire, Scotland, evergreens and ornamental trees; Thos. H. Spaulding, Orange, N. J., chrysanthemums; Orcutt Seed & Plant Co., San Diego, Cal., nursery stock; Wm. Paul & Sons, Waltham Cross, Herts, England, roses; Benj. Hammond, Fishkill-on-Hudson, N. Y., insect destroyers; A. Cauchoix, Orleans, France, roses; Isaac F. Tillinghast, La Plume, Pa., seeds.

News Notes.

MASON CITY, IOWA.—A. L. Wheeler has just completed a new house 18x59.

CRESTON, IOWA.—F. T. Brown has just completed two new houses 17x100.

LUDINGTON, MICH.—Wm. Gregory has just completed a new greenhouse 18x100.

MANISTEE, MICH.—Otto Baumann has started into business here with one greenhouse.

SACO, ME.—Geo. L. Mahoney has recently completed a new greenhouse 16x65.

BALTIMORE.—Wm. J. Halliday has opened a new floral store at 304 W. Madison street.

MILWAUKEE.—Kitzetow Bros. have just started greenhouses on the Green Bay road, and John Dumlup, Jr., has done likewise at Waukesha.

BELLEVUE, PA.—On the morning of December 1 four greenhouses belonging to Fred Burki were destroyed by fire. Cause was natural gas and defective flues.

MILWAUKEE.—The Wisconsin Flower Exchange has been incorporated. The incorporators are Wm. Whitnall, C. B. Whitnall, B. Gregory, F. R. Ellis and B. M. Walters. Capital stock \$2,000.

SUMMIT, N. J.—The Social Florists' Club of New Jersey now has about forty-five active members, all young men growing up in the florist business. A library is being collected as fast as means will permit.

PITTSBURGH.—Mrs. Schenley of London, England, who inherited and owns a vast amount of real estate in this city, has given 300 acres of land, lying mostly in the 22nd ward, for a public park to be known as Schenley Park.

PITTSBURGH.—Fire at the greenhouses of Chas. T. Siebert caused a loss of \$3,000 on buildings and plants the morning of December 2. Four greenhouses were partly destroyed and the boiler room totally. No insurance.

LOUISVILLE, KY.—The firm of Haupt & Epping has been dissolved. Epping has gone back to the greenhouse business and Haupt has the cut flower store. Fire destroyed about \$500 worth of plants at E. G. Reimer's greenhouses recently.

CHICAGO.—Paul Bork has started into business at Evanston with two houses, one 20x100 and the other 17x100. He will grow cut flowers for the Chicago market. Schiller & Mailander have established a city store at 570 West Madison street.

RUTLAND, VT.—The fire at W. D. Lane's greenhouses, November 17, destroyed the office, containing seeds, bulbs, supplies and utensils, but only about 600 feet of glass was lost, though many valuable plants destroyed. The loss is estimated at \$3,000 with insurance of \$1,050.

NORTH WALES, PA.—J. K. Anders has put in a 35-horse power boiler and is now heating his greenhouses by steam. John Ashford has made an addition to his greenhouse, which is nearly completed. John Gearhart has purchased a 15-horse power boiler and will heat by steam.

LONDON, ONT.—At the meeting of the Gardeners' and Florists' Club held December 2 the following officers were elected for 1890: A. R. Murdock, president; Geo. Robinson, vice-president; Wm. Gammage, secretary; Geo. Cairncross, treasurer. W. H. K. Talbot and Geo. Cairncross were elected representatives to the Western Fair Board.

LEBANON, MO.—The thirty-second annual meeting of the Missouri Horticultural Society held here the first week of this month was one of the most pleasant and interesting ones ever held by the society. The stage in the opera house where the meeting was held was handsomely decorated with ornamental plants. The exhibits were mainly of fruits.

BUFFALO.—At the last meeting of the Buffalo Florists' Club a very interesting paper was read by Prof. J. W. Cowell, on the diseases of plants, illustrated by a diagram of plant roots in various stages of disease, microscopic views of black spot, red spider, aphid on the foliage and on the roots, giving an insight into the manner in which these pests injure plants. It was the first anniversary of the club and after the business of the evening had been transacted all adjourned to the supper room where a substantial repast was enjoyed. The responses to the toasts were happy and there were many wishes for the future prosperity of the club.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. MCCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1899.

THE NEXT QUESTION is how low will the price of sweet corn go?

HENRY A. SALZER is threatened with loss of his eyesight and is now confined to the house.

PASSED through Chicago: Dan'l DeCon, of S. L. Allen & Co., Mr. Chas. Woodhill, of Thorburn & Co., N. Y., H. W. Buckbee, of Rockford, Mr. Rendell, of Burpee & Co., C. E. Corrigan, of N. B. & G. Co., Mr. T. Webster.

Boston Notes.

The Mass. Hort. Society has arranged to hold the annual exhibition of plants and flowers during the time of the convention of the S. A. F.

The December meeting of the Gardeners' and Florists' Club was largely attended. "Primulas" was the subject under discussion. The reputed poisonous effects of *Primula obconica* were vigorously disputed "pro and con."

F. C. Fisher of South Sudbury, for the past few years a large grower of carnations, died of hemorrhage at his home on December 5. He was a member of the Society of American Florists and a frequent exhibitor at the Mass. Hort. Society's shows.

The first cold weather of the season has been experienced during the past week, with the usual result of a big jump in the price of roses. Up to the present time prices have averaged lower than ever before. Chrysanthemums are about gone. Those who have any left now will get good prices for them. The demand for violets for corsage wear this season amounts to almost a craze. They are decidedly the most popular flower at present, and are none too plenty. Harrisii lilies will be in fair supply for Christmas. W. J. S.

Fumigating.

I wish to add my testimony as to the superiority of evaporating tobacco water to burning the tobacco for fumigation. I always keep a barrel full of tobacco stems soaking in water and have a tin pan 2x3 feet and 4 inches deep. I fill the pan about half full of tobacco water and then put in it three or four red hot fire bricks. It kills greenfly very quickly and never injures even the most tender plants. Omaha, Neb. A. Hooge.

Method of Glazing.

In No 58 of the FLORIST, page 230, of Vol. 3, is illustrated a method of glazing used by a florist in Richmond, Va.

I have tried the method and it is not satisfactory here in the north, at least with me, as frost soon works the glass loose. I have had to relay the glass on my roofs at some cost and thought should make known my experience for the benefit of other northern florists. Lansing, Mich. F.

Heating.

We watch with interest the various arguments on the comparative value of hot water and steam for heating.

Our houses are piped for steam, but we

use both hot water and steam. We can change over in 20 minutes from hot water to steam, or vice versa. In mild weather in fall and spring we find it very handy to use hot water, as it is less trouble to look after the fires. We use one or two 20-horse power wrought iron boilers, as the temperature demands.

M. WINGATE & SON.
Lawrence, Mass.

Peter Henderson's Wonderful Feat.

Little May, aged about 7 years, was sitting on her father's knee, one day, when some one happened to mention the name of the well known florist. "Oh, yes," said May, "my aunt knows Peter Henderson. Peter Henderson was out in the boat and he tried to walk on the water to Jesus and he got scared, and Jesus called him, and Peter Henderson was afraid, and he sunk down in the water and—"

"What!" said the astonished father. "Yes," she cried. "My aunt told me all about it. Peter Henderson tried to walk on the water, and he couldn't do it, and he was going to get drowned; and then Jesus he put out his hand and Peter Henderson got a hold of it and then he walked on the water."

Argument and explanations were tried, but the convictions of little May remain unaltered. She insists that Peter Henderson was the man, because her aunt knows him and said that he walked upon the water.—*Jersey City Journal*, Nov. 18.

SAN FRANCISCO.—The State Floral Society realized a profit of \$75 over all expenses from the recent chrysanthemum show. The newly adopted constitution of the society among other things provides that all the officers shall be amateurs, provided, by general consent at the time of election, one or more professional florists may be chosen, but the board of directors, by and with the consent of the society, may choose an advisory board of three from members who are professionals.

(ESTABLISHED 1857.)

Will be pleased to quote special prices for garden, agricultural and flower seeds saved at his extensive grounds, which cover more than 4,000 acres.

To The Horticultural Trades

GREETING.—This is simply to remark that we have cut discounts to Advertising Agents down to a low figure. So if you are placing your order through an agent, you may have to INSIST on his including *The American Garden*, to prevent substitution of a less valuable medium. YOU know well enough that there is NO OTHER WAY so low in cost for the results secured, for reaching the best grade of Horticultural Buyers.

YOU MISSED IT if you did not get your ad. into the January number (now closed) which is to be a great double extra edition, of extra size and numerous illustrations. BUT when you see that number, and reflect that those to come after will be very nearly as good (perhaps better), THEN you will lose no time in forwarding your "copy" for an advertisement.

ADDRESS **J. A. DE VEER,**

183 Water Street, NEW YORK,

Indianapolis.

The recent chrysanthemum show was not a financial success—that is there was no surplus—but all premiums and expenses were paid in full, and the beneficial effect of the exhibition is already apparent in an increased demand for flowers of first quality. Rubbished chrysanthemum blooms will have to take a back seat another season.

A fine exhibition of rose buds created a lively interest at the last show. M. A. Hunt, of Terre Haute, showed some Perles, which some eastern florists, who were present, said were the best ever shown anywhere. He also showed some fine Duchess of Albany, the coloring of which was notable. C. L. Mitchell and Hill & Co., also had fine exhibits of roses.

Seedling chrysanthemums entered in competition for the silver cup, and which were not mentioned by the judges, were considered to be no improvement on existing kinds.

The annual meeting of the State Hort. Society was held in the State House, December 3 to 5. Eighteen members of the local Florists' Club attended a session of the Hort. Society, and as a result of a conference with its officers a suitable horticultural hall will be arranged for at the State Fair grounds.

The annual meeting of the Society of Indiana Florists will be held at the State House, February 26 and 27.

A spring exhibition will probably be held by the local society in the city hall. Very few premiums will be offered, but a creditable display will be made by all prominent members.

Mrs. Henry Hilker died recently. The funeral was attended by members of the Florists' Club, who carried with them a suitable floral tribute. Henry Nicolai has been appointed executor of the estate.

B.

Washington, D. C.

At a recent dinner given to the members of the International Maritime Congress a slender, well proportioned light house made of chrysanthemums and surmounted by an electric light elicited general praise.

Chas. F. Hale has located in the West End in a store specially fitted up with sky lights, at 1020 Connecticut Ave., and makes a fine display. A. & W. B. Garden have opened an attractive establishment near by, and W. S. Clark who has heretofore represented Sutherland of Philadelphia, in the seed department among the commission merchants of B street has opened an establishment of his own at 609 12th street, and now keeps cut flowers, etc. Fisher has returned to his former location on Pennsylvania avenue.

Something of a novelty here in floral designs appeared recently on the occasion of the reception given Miss Clara Barton, president of the American Association of the Red Cross. It consisted of a miniature tent 18x24 inches and corresponding height, made up of Cape flowers. In front the flaps were turned back displaying an interior suitable for hospital purposes. Over the entrance a Greek cross in scarlet immortelles, on one side of the roof in purple letters appeared the donors name: Pontiac W. R. C.; on the other side Maltese cross in flame colored chrysanthemums. Stringers of green held the tent fast to a neat base of matted ivy leaves. A miniature American flag and the Red Cross standard waved from the staff. The whole presented a decidedly unique appearance—proportions being well preserved and colors in good taste. Small & Sons were the designers. Z.

NEW AMERICAN CHRYSANTHEMUMS.

HILL & CO.'S SET OF 12 will be ready for delivery March 1st, 1890. These are the products of some of the best raisers in this country. The list includes

HARRY E. WIDENER, winner of the Blanc prize at Philadelphia show.

JOHN LANE, a magnificent pink, raised by W. K. Harris.

MRS. J. K. EMLEN, an improvement over Mrs. A. Carnegie.

CROWN PRINCE, of the Wheeler type, petals 3/4-inch in width.

MOLLY BAWN, a pure white sport from Syringa, two years.

CLARA REIMEN, rich lavender rose in color. Certificate of merit.

CARRIE DENNY, clear amber, entirely distinct from anything in cultivation.

MRS. WINTHROP SARGEANT, brilliant straw color. Largest in this line of color.

CHARLES A. REBER, rosy pink, with shadings. A fine exhibition plant.

MRS. EDMUND SMITH, a beautiful fine white, of an entirely new type of flower.

ROBERT S. BROWN, four times as large as John Welsh with the same intense color.

MISS MARY WEIGHTMAN, chrome yellow; large flowers, 10 in. in diameter.

Lists on application, with descriptions of the twelve. Orders booked in rotation.

PRICE, PER SET OF TWELVE, \$10.

We have arranged to offer Mr. T. H. Spaulding's new set, also Mr. H. Waterer's new ones for 1890. Same price as the raisers.

REMEMBER THE FINEST CHRYSANTHEMUM OF THE YEAR IS OUR HARRY E. WIDENER.

We shall be pleased to make prices on lists of Chrysanthemums. All the New Prize Winners of this year (1889) in quantity for Jan. delivery.

HILL & CO., Richmond, Ind.

For Samples address SLOC SHOT, Fishkill-on-Hudson, N. Y.

St. Paul.

At a meeting of the florists of this city held some weeks since, the St. Paul Florists' Club was organized and officers elected as follows: President, A. H. Bunde; Vice-President, J. Fleischer; Secretary, Louis Venzke; and an Executive Committee of three, one of which will be elected at each monthly meeting to serve three months. This committee will arrange a scale of prices every two weeks, which the members of the club agree to abide by. This action was necessary on account of dull times, poor business and close competition. The cutting of prices had been so recklessly indulged in that we were losing money on everything we sold. It is hoped that harmony will now prevail and that all will be benefitted alike.

Business has been very dull here the past summer and the outlook for the winter season is not as encouraging as it might be. Flowers are plentiful and the quality is good, thanks to the splendid weather we have had this fall.

A great deal of new glass has been added the past summer and the supply seems to have increased at a more rapid rate than the demand. Two new stores have been opened here this fall. The same may be said of our sister city, Minneapolis, and florists there are complaining.

The Society of Minnesota Florists held a special meeting November 19 for the purpose of discussing the chrysanthemum, and quite an exhibit of cut blooms, containing some 200 varieties, was shown, some very good ones among them, although the season has been rather unfavorable. Ang. S. Swanson read a paper on the cultivation of chrysanthemums for exhibition. Quite a lively discussion was had on a statement by the essayist to the effect that he preferred cuttings from the branches of the plant to those from suckers, claiming that better plants could be grown from the first named cuttings. The prevailing opinion expressed by other members who took part in the discussion was contrary to the position taken by the essayist. I think that many would be glad to hear the opinions of other chrysanthemum growers on this point through the columns of the Florist. It would be a good thing to have the matter definitely settled.

THE "PLANET JR."

HORSE HOE has a world-wide fame, and its hosts of friends will be delighted with its improvements for 1890. **First LEVER EXPANDERS** Instantaneous in action, firm, strong, simple, accurate, perfect. **Handle Adjustment** Quick, still, grand for grapes, corn and in covering. **Parallel Frame** Stands interchangeable, STRONG, neat, CONVENIENT, imitable. We absolutely guarantee our 1890 Horse Hoe and combinations, and new patented features to please every practical farmer and gardener, and their money value to be far greater than ever. Look at it, and write us. Catalogue free. The "PLANET JR." **Hand SEED DRILLS, Double and Single Wheel Hoes.** "Fire Fly" Plow, &c., are indispensable to farmers and gardeners. They sow with regularity any thickness and depth, difficult and easy seeds in small or large quantity, and without danger to vitality and without special care. In market gardening the **Wheel Hoes** are daily and every day. The "Fire Fly" Garden Plow is a delight in the family vegetable garden. The "Planet Jr." combined Seed Drill, Wheel Hoe, Cultivator and Plow combines in an admirable way the qualities of all the rest, being delightful as a seed Drill, Double Wheel Hoe while plants are small, Single Wheel Hoe, Cultivator—deep or shallow, and Garden Plow. All the blades of these famous hand tools have long been made of hardened polished steel. Keep them bright and sharp, and you will save the full cost every few days. Send for full Descriptive Catalogue of all our goods. Write us your wants. S. L. ALLEN & Co., Sole Mfrs., 1102 Market St., Philadelphia.

HUGHES

SOLUBLE FIR TREE OIL.

FLORISTS AND NURSERYMEN SHOULD NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants: such as ferns, etc., if used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

Christmas Greens.

This trade embracing by a liberal interpretation holly, lycopodium, mistletoe and Christmas trees, plays nowadays no small part in the florists' holiday trade. Neither is the full supply of such stock provided at the right time in salable condition a small matter, for all are easily spoiled, in demand but a few days and really profitable only when in best condition. The season just passing may be called one of scarcity. Lycopodium was early covered by snows in the northern woods which never sufficiently disappeared to renew the picking, hence the supply provided was limited as well as somewhat dried up and brown from having been gathered so early; only the most cautious of the wholesale dealers were able to fill contracts with first class stock.

The holly supply, while not a short one, was much poorer in quality than last year, the holly trees seem to have a "bearing year," as do many of our fruit trees, and this was not that kind of a year. The rains of the last week in November filled the holly swamps with water and delayed the gathering, which retarded many shipments, while the warm weather must have injured the stock after packing, for many cases though gathered as late as possible proved brown on opening and others received in good order soon faded. There is little doubt that holly must be kept as cold as possible, down to 30° to hold it bright and fresh. The holly trade is certainly on the increase, the florists were hardly hopeful enough to order a proper supply early and the result has been added expense in express charges to provide for the sharp demand experienced the five days before Christmas. The wholesale men claim a season of short supply is necessary to remind buyers how important it is to order these supplies in ample season at low contract prices, providing as nearly as is possible with such stock, for its delivery at proper time and lowest transportation charges.

Mistletoe is one of those items of which it may be safely said "it costs more trouble than it is worth." It is more easily damaged by heat or cold than any of the others; the imported article overhauled on the ocean steamers and the domestic freezing before arrival in the northern market. The past two seasons have been mild and the southern stock when it did come arrived in fair order and sold readily. Further trouble comes from the unreliability of some southern dealers, the slow freight deliveries and high express tariffs, all of which combined make it possible to say of it that you never know you have it till it comes.

A suggestion here to those who have not a "calendar of seasonal operations," make note that green or holly should be ordered by October 15. The amount of wreathmaking made and sold, the number of

holly and green wreaths sold, the relative demand for all of this and similar stock and the days of greatest demand should all be carefully noted that the great law of supply and demand may another season be fairly met by you in this direction.

Some of our readers may not be acquainted with the full line of odds and ends of Christmas decorations retailed in the larger cities; we mention here a few of those not named above: fan palm leaves, Georgia or southern needle pines, Florida grey moss, bells of scarlet immortelles, pampas plumes, these mostly sell well; grass bouquets will sell to a class of customers who can not afford fresh flowers at Christmas.

Nomenclature.

In continuation of Mr. Whittle's remarks on nomenclature I wish to say that the committee appointed by the national society a year ago did not so far as I have been able to learn, make any effort to accomplish anything. The FLORIST has frequently suggested that members having any information pertaining to the subject should forward it to this committee, but outside of the FLORIST's efforts nothing has been done. Such a committee is no good; it was their business to map out some plan of action, to determine what course to pursue and after doing so to make the announcement to the society at large so that all interested could tell how to take hold and where to fall into line.

I should like to suggest a plan which I think if adopted would start the ball rolling and would overcome some difficulties which now exist, it is this: The executive committee of the national society to act as a supreme court, each vice-president as a district attorney for the state which he represents. It shall be the duty of each V. P. to work up every case which is brought to his attention inside his state, and as soon as he has all the details arranged he must notify the secretary of his having a question to be decided, at the same time explaining the nature of the case. It will then be the duty of the secretary to notify the V. P. when and where the committee will meet and consider his question, requesting him to be on hand and present the case. If it should be a complaint arising from some alleged fraudulent practice the defendant should also be notified to be on hand, if it is a new plant requesting a certificate of merit, the V. P. must provide a sample, photographs, testimony, etc. The committee must have the right to employ an expert in special cases where they see fit, all reports, decisions and awards to be published in the annual report of the S. A. F.

The first question I should wish to submit to this honorable body is: What is a

florist? I call myself a florist, I have read the AMERICAN FLORIST carefully since its first publication, and have taken an interest in the S. A. F., etc., also have I consulted Webster's Dictionary. The difficulty is this: We florists have been changing our habits from year to year until Webster's definition is too narrow. It does not cover the ground. Webster says: "one skilled in the cultivation or care of flowers." I should call such a person a gardener, but does any one cultivate flowers or do they cultivate blooming plants? A person who keeps a city store and purchases his stock, although he handles quantities, arranges them beautifully, etc., is not a florist.

C. B. W.

New Varieties.

In an article on nomenclature Mr. Whittle decries the influx of so many new varieties of plants of inferior merit. "Why don't he criticise the inferior new varieties?" as he says the critic of new literature criticises our books. But it is a well known fact that the literary critic is not always correct in his criticism, and that a book or play has been an unprecedented success in spite of adverse criticism, and vice versa. We have a number of similar examples in the case of plants where men supposed to be competent judges and skilled horticulturists have discarded varieties as worthless, while others have made the culture of the same varieties a complete success.

I am afraid Mr. Whittle will have to advance a better solution of the problem than committees or experimental gardens, and revert to the old way of spending a little cash; or let the new plants alone and patiently wait and admire his more enterprising brother horticulturists' success; or better still, give his attention to raising new varieties, give his brother florists the benefit of his criticism on them and enshrine his name in the annals of horticulture as a benefactor to the trade and the lovers of floriculture in general.

Furthermore, he can turn his attention to establishing horticultural exhibitions in every town and hamlet in his vicinity, enlist the masses, offer premiums for new and old plants, appoint competent judges as critics, and the people will supply the experimental gardens. After he has successfully completed his task in his own vicinity he can communicate his experience and advocate his methods to the country at large, he might then be appointed secretary and horticultural critic, for say the confederation of horticultural societies of the U. S. A.

Fairfield, Conn. JOHN DALLAS.

What is a Disease?

At a recent meeting of the Baltimore Florist Club this question brought out considerable discussion and a diversity of opinion was expressed.

I especially desired further information regarding what is called the "aster disease" which has been mentioned several times in the FLORIST. Mr. Thorpe opened my eyes when he stated that an insect was the cause of the "disease" which resulted in the death of the plant in a day or so, especially when in bud. I know that when Mr. Thorpe makes a statement of this kind he has had evidence to base it upon, so I was much surprised, as I have never found any insects in my asters which have suffered from the ravages of the disease. Every year I have lost a lot of plants from this pest whatever it may be, and for the last two years

have been experimenting. I find that where planted in virgin soil no plants are attacked, in other soil without manure but a few are lost, but as soon as I give manure—no matter how old—I am bound to lose them all. I planted about 100 plants in a pansy bed, the soil of which was very rich and they all died when the flower buds were ready to open. Next to them I planted the same number in virgin soil without manure and none of them died.

Mr. Fraser claimed that whether the death of the plants was caused by an insect or an overdose of humus it was not a disease. That if the plants were overed it was due to mismanagement, and if killed by an insect their death was the result of accident. He instanced the violet "disease" as another case of the same kind and both he and Mr. McRoberts maintained that if a disease it would be general among all the violets grown in this vicinity, whereas some growers' violets were as healthy as they could possibly be while near by other growers had been forced to abandon the culture of the violet on account of the disease. The statement was made: "If you can not grow a plant in your soil or locality give it up, but do not call the failure the result of disease." It was also held that mildew on roses is not a disease, "only a fungus for the growth of which proper conditions were supplied by a draught or some similar cause which with proper care would have been avoided." I am now anxious to know what may be considered a disease. ED. HERKMANN.

Baltimore.

An Enjoyable Event.

The opening of the reading room and bowling alley of the New Jersey Social Florists' Club at Mr. John N. May's, Summit, N. J., is deserving of more than a passing notice. It was one of the most pleasant occasions that it has been our privilege to enjoy. And this every person can understand who has had the pleasure of Mr. and Mrs. May's hospitality on other occasions.

The New Jersey Social Florists' Club is fortunate in having its headquarters at Summit, and with such a presiding genius at its head as Mr. May. No detail, no matter how small, was overlooked in the arrangements for making its guests feel at home. Many were the favorable comments made upon the busy minds which conceived and the willing hands which executed these details.

The ceiling was completely covered with cedar boughs and the chandeliers were draped with the ever-graceful smilax, while the tables were decorated profusely with cut roses and other flowers, and pot plants of *Dracena fragrans* and *Pandanus Veitchii* added wonderfully to the tasteful decorations.

The menu was an elaborate one, to which ample justice was done as only the keen appetite of a tiller of the soil can do, after which came the "feast of wit and flow of soul." About 100 members and friends of the craft sat down at the banquet.

Mr. May presided and acted as toast master. Speeches, singing and instrumental music was kept up without intermission until a rather late hour.

A more distinguished gathering of the craft outside of a regular meeting of the S. A. F. was never seen in this country before. There were all the ex-presidents of the society present—John Thorpe, Robert Craig, E. G. Hill, and our worthy host J. N. May. Secretary Stewart, P. Norton and other notables from Boston

were there. The horticultural press was ably represented in the person of W. A. Stiles of the *Garden and Forest*. From Philadelphia in addition to R. Craig were John Westcott, C. F. Evans, W. K. Harris, John Burton and G. C. Watson. James Taplin and all the well known growers and retailers in and around New York added lustre to the assemblage. Of course J. A. Penman was there.

It will ever be remembered as a bright spot in the lives of all who had the good fortune to be present.

EDWIN LONSDALE.

Vase of Chrysanthemums.

The accompanying photo-process plate is from a photograph of a vase of chrysanthemums, the majority being recent introductions, as shown by the names attached. The engraving has been kindly loaned to us by Mr. A. Blanc, the Philadelphia engraver.

The Night Man.

Do you keep a man on duty all night? Some do, some don't. In large greenhouse establishments it is considered the proper thing to do, but in lesser ones it might seem superfluous. A man on duty all night means one man less for work in the daytime. But this depends.

We have a night man, have had one for years, and I regard him as one of the most useful helps I have got. The night duty lasts between the end of November and the first of April. He comes on at 7 p. m. and stays on duty till 6 a. m., and he comes to work. He is a handy laborer accustomed to work about a greenhouse. The proper temperature is written up in each greenhouse and this heat he maintains exactly. And he does all manner of plain potting, pricking off seedlings, putting in cuttings, pointing, dipping and preparing stakes, painting labels, cleaning seeds, picking moss, mending wooden flats, and a host of other little jobs incidental about a greenhouse and which have got to be done anyway. And he wages war upon snails, cockroaches and mice. If it turns suddenly frosty at night he is there and will spread the mats on the cold frames in winter and hothods towards spring—I now run 200 sashes of cold frames, more than half of them filled with vegetables as lettuce, parsley, spinach, etc.—and will turn on a little heat in the warm frames. If a storm comes up in the night time and blows the mat or thatch off of a corner of a frame or a pane of glass out of a greenhouse, the night man is around and looking for just such mislapses to rectify them. Yes, and if need be he will saw hard wood for the pump engine, but he doesn't like this job.

And he saves me a great deal of work in another direction. After the first of December we can not trust the weather, it may be warm enough in the evening and blow up cold before morning. Were it not for the night man this would necessitate covering up our frames every afternoon before dark and, in fine weather, uncovering them again next morning; with him on duty, however, we don't cover our frames unless the indications are positively for cold, if cold should spring up in the night time he can soon spread mats or thatch enough to save things till morning.

He can cut, sort and pack flowers. And I have no occasion to fret about things at home if I am away from home at night, and there is always some one to hitch up and meet me if I am coming home late, for our place is three miles from the railroad station.

VASE OF CHRYSANTHEMUMS

He is peculiarly religious. On Saturday night beyond filling up the tanks and his duties of attention, he will do no potting, staking or other work because to-morrow is Sunday, and on Sunday night beyond his duties of attending to fires and things and hunting for slugs he will do no work because it is the Sabbath.

Now, it is well to humor the night man in the way of work. He hates washing pots and sawing wood. But he delights in potting, pricking off seedlings, making and putting in cuttings and nice little jobs of this sort, and he will do good work and lots of it too.

Go out and see him every night before bed time, and go around the place with

him, it will satisfy yourself, break the monotony for him and cheer him up a bit.

With a night man on duty everything goes along like clockwork and systematically, and you needn't worry yourself half to death, or ruin your health by jumping up out of bed and running out to fix your fires at 2 o'clock in the morning, maybe lying awake till then lest you should oversleep yourself.

I know a good deal about the old—and yet common—system of one man attending to the fires at night before midnight, and another getting up early in the morning to see to them; I have done it myself, and for years used to have it done for me, but, really, I would not entertain it one

minute to-day—the night man is by far the safest, most pleasant and profitable.

WM. FALCONER.

Begonia Incarnata (rosea) Grandiflora.

Had several inquiries concerning this most useful plant since I called attention to it in these columns, as to the proper treatment, but can not say much more than I have said formerly, only I must add that it never should be allowed to fill the pot entirely with roots if you want it to retain its foliage in a good healthy condition. If repotting is neglected the foliage will soon turn yellowish and smaller leaves will be produced on the

new growth. In order to get the best results we should keep them growing vigorously from the first start until all the flowering branches are cut. I have a house full of them now (December 15) and have been cutting therefrom for a month or more, but on examination we find that very few roots have penetrated the soil and barely show at the edge of the pots. We keep them in a rather cool house with plenty of air on in favorable weather and never give them too much water. If kept on the dry side the flowers will be of a much brighter and darker color than in a warmer place or if given abundance of water. As to the soil we use it is only decayed sod and thoroughly rotted manure of any kind with good drainage in the bottom of the pot. If bone, or in fact any artificial manure, is used it should be but very little of it or you will surely spoil your plants entirely and I should rather not use any if well decomposed cow or stable manure is not available. I also find that young plants invariably do best with me, even cuttings made very late in May will make plants of ample size in 6-inch pots and be covered with bright pink large clusters of flowers for Christmas and New Years, while old plants will begin to bloom much sooner, but the foliage will generally be rather small and the clusters of flowers have the same defect, unless you would allow them extra large pots.

I am very much pleased to hear that this plant is now grown more extensively in place of the older common *B. incarnata*, and also that it is thought of most favorably by many as a decorative plant, not only for the holidays in churches etc., but also as a house plant. I have seen it at a number of places this fall and found that in most cases no difficulty was experienced in growing it to perfection, only a few instances of partial failure came to my notice, but perhaps repotting was not attended to in time or some artificial stimulant may have been used to excess or manure was not very old when mixed into the soil; surely one of these conditions must have existed or else the plants would be uniform in size and in healthfulness. Everybody, however, thinks it a decided improvement on the old variety and just as easy to grow.

Rochester, N. Y. JOHN B. KELLER.

New Chrysanthemums for 1890 Which Originated in Philadelphia.

This has been a remarkable year for new chrysanthemums, and as Philadelphia has added perhaps more than its quota of sterling varieties to the list, and as many of them have flowered since the closing of the shows, a few notes about those that are likely to render a good account of themselves in the future may not be out of place at this time.

H. Waterer has the honor of having distributed many of the very best chrysanthemums for this climate that are now in cultivation. A collection of some 25 or 30 varieties which were imported direct from Japan, under numbers, and disseminated in the springs of 1884 and

1885, contained some sorts that may still be found in prize winning collections. Among them may be mentioned, as subsequently named by Mr. Waterer: Mrs. Charles Wheeler, Mrs. Frank Thompson, Snow Storm, Robert Bottomly, Glorissimo, Mrs. George Bullock, Syringa, Jessica, J. Collins, President Arthur, "H. Waterer" and many others. For a year or two there was some confusion as to the names, as they were propagated and sent out before they flowered, and it was discovered that the numbers had not proved reliable, and this may account for the fact that the Europeans, sometimes, accuse their American cousins of carelessness, or something worse. Happily that time has passed and the leading florists and dealers of this country are as conscientious as the same class of men are to be found in any other country. That collection of Mr. Waterer's marked what might be termed an era in the chrysanthemum in this country, and it is from that collection and the descendants thereof that the new and improved varieties are still coming.

Mr. W. K. Harris was the first to undertake the raising of seedlings in this city, which was commenced in a modest and unostentatious way, but now his seedlings number in the thousands and he devotes several houses to their culture and development.

Mr. Thomas Monahan, gardener to C. W. Trotter, Esq., Chestnut Hill, has also been very fortunate in his productions. His "Edwin H. Fidler" stands alone as one of the most distinct varieties ever introduced. Its weak spot is its constitution. It is what is termed a "poor grower," but when found in good condition it is grand.

Mr. Robert Carey, gardener for T. C. Price, Esq., of Chestnut Hill, was the fortunate originator of the now well known "T. C. Price."

Mr. William Jamison, gardener for R. D. Mason, Esq., of Germantown, must be congratulated on his production of the novelty of the year "Harry Elkins Widener," of which more anon.

Mr. John McCleary, gardener for John Weightman, Esq., also Germantown, enters the list as a raiser. His "Miss Mary Weightman" is a very good one, and will be noticed at greater length later on.

Mr. Henry Surman, gardener for E. W. Clark, Esq., has also been a prize winner with his seedlings. His "Mrs. E. W. Clark" is well known wherever good chrysanthemums are grown.

A list of the varieties which Mr. Waterer disseminated last spring will give an idea of the standard of his more recent introductions, most of which were raised by Mr. W. K. Harris, to wit: Mrs. Wm. K. Harris, Violet Rose, Ivory, Excellent, Miss Annie Hartshorne, Wm. Dewar and Thos. C. Price.

Those which he intends to send out spring 1890 are as follows:

Reward (Harris), reddish maroon, very distinct in color, immense spreading flowers.

President Harrison (Monahan), so named by the raiser early in the morning of the day after the last Presidential election. The flower is cup shaped, red in color with a dash of yellow, giving it a salmon tint, deep red center, enormous flowers, a good grower.

Mrs. Frank Clinton (Harris), very light canary color, full to the center, of good habit, quite distinct.

Eclipse, bright mahogany red in color, very effective, good grower, incurved.

Model, a pleasing shade of pink, some-

what deeper than Lilian B. Bird, flower perfectly double. In shape resembling "Gold."

Comet, very full flower, yellow center, outer petal florets white and drooping, large.

White Cap, white in color at top, deep violet purple beneath, incurved when first open, afterwards drooping, very distinct.

Twilight, large flat full flower, in shape similar to Excellent (one of last year's introductions), lemon yellow center, outer petal florets white.

Edwin Lonsdale, said to be the deepest and richest colored variety in cultivation—the color of "old port" wine—flower very large and full, habit of plant dwarf.

Mrs. Charles Dissel, immense flower, incurved, light but bright pink in color, a great improvement on Mrs. Frank Thompson, one of the largest chrysanthemums ever brought before the public, and one of the best of the year.

The following will be sent out by Messrs. Hill & Co., Richmond, Indiana. Many of them having been selected by Mr. Robert Craig, whose judgment in such matters can be entirely depended upon, as witness the collection sent out by Craig & Bro. last spring: Mrs. Irving Clark, Mrs. Mary J. Thomas, Mrs. Isaac C. Price, Edwin H. Fidler, Mrs. Joel J. Bailey, Mrs. A. Blanc, W. W. Coles, L. Caming, Sunnyside, Dr. Stryker, Mrs. Levi P. Morton and some others.

The list above referred to, to be distributed next spring follows:

Harry Elkins Widener is one of the best chrysanthemum ever raised. It was awarded the "Blanc Prize" at the last show held in Philadelphia. It originated with William Jamison. It was purchased by Hugh Graham's Son, and by him disposed of to Craig & Bro., who in turn sold it to Hill & Co. Several disseminators of new and improved chrysanthemums tried to buy it. The price paid was \$300. In color it is lighter than grandiflorum, a bright lemon and larger in size, incurved and carried on stiff erect stems. Grand for either exhibition or cut flower purposes.

Crown Prince (T. Monahan), a magnificent incurved flower in the way of Mrs. Charles Wheeler, but it is more than twice as large. In color it is crimson on upper surface of floret petals and bronzy yellow beneath.

Mrs. J. T. Emlen (Monahan). This is a decided improvement on "Mrs. Carnegie." It is a good grower and throws its flowers well up on strong and erect stems.

Molley Bawn (Monahan), is a pure white sport from Syringa. Good for any purpose.

Mrs. Winthrop Sargeant (Harris), very pale yellow, a new shade, difficult to describe, large flowers, incurved, freely produced on stout stems, a fine flower.

Mrs. Edmund Smith (Harris), a beautiful and pure white with long and narrow petal florets, which are beautifully interlaced, they are of great substance, lasting a long time in perfection. Exquisite.

Carrie Denny (Harris), another new color, a deep rich shade, suggestive of amber, incurved.

Miss Mary Weightman (McCleary). In the way of Mrs. Wm. Mencke, but much larger, and it comes into bloom at least two weeks earlier.

Robert S. Brown (Monahan), similar in color to Hon. John Welsh—a rich deep purple. It is a healthy grower, an abundant bloomer, and the flowers are four times as large, and apparently possessing more substance than the older variety.

CHRYSANTHEMUM HARRY E. WIDENER.

John Lane (Harris), incurved, lovely pink in color, very large, good for any purpose, but especially so for cut flowers, pronounced the best of the color up to date.

If most of the above are not found in every winning collection next autumn, both as cut flowers and specimen plants, I shall be very much mistaken.

EDWIN LOXSDALE.

Wyndmoor, Dec. 24, 1889.

Chrysanthemum Harry E. Widener.

This has been pronounced by competent judges to be one of the very best new chrysanthemums and the finest yellow yet produced. It is bright lemon yellow in color, flowers large, borne on stout

stems, the plant of excellent habit. This is the variety which received the Blanc prize, a silver cup, at the Philadelphia show. The engraving is about two thirds the size of the flowers exhibited, and is from Mr. A. Blanc, the Philadelphia engraver.

Spoiling the Chrysanthemum.

The florists and gardeners are at their old tricks again, and all the beauty and grace of the chrysanthemum are being destroyed. In their place we have objects as artistic and delightful as the cauliflower, that pride of horticulture, or as charming to view as that handsome object, the cricket ball. The average gar-

dener considers a good incurved chrysanthemum as the perfection of beauty and art. To any lover of flowers, to say nothing of any person with any artistic sense, the incurved section are simply hideous monstrosities. Then to hear of their being curled, and frilled, and set with other petals and gum is as disgusting as to see people frizzed, or dyed, or made beautiful for ever by Mme. Rachel. Surely such vulgarities should be eschewed in the garden of all places.

People were formerly in the hands of the gardeners and florists in such matters. They laid down that a carnation must be an exact circle, that a pansy should be something else, and that an auricula should assume such and such a form, and

the public accepted their decision blindly. A better era has now dawned, and employers can indulge their sense of artistic propriety without being considered to be heathens. Surely the chrysanthemum can be saved from the doom of the double dahlia, which has gone to a limbo where it can rest with cut turnip flowers and the ghosts of ribbon borders. What was it that pleased

The gentleman of Japan
(in many a vase and jar?)

Was it not the beautiful irregularity, the disorder in order of his native chrysanthemum? Are the tasteless people who squeeze out the flowers flat on a card, and curl their petals with ivory tongs, and snip them with special tweezers, and insert foreign petals with some other tool, to deprive us of all this grace and beauty? Are the lovely Japanese petals to be thickened and fattened till they look like the petals of *Globe artichokes*? Are the flowers to lose all their graceful outline, and to be reduced to the beautiful round contour of the incurved section? Truly, I hope not. Let all who care for gardening discard not only incurved chrysanthemums, but all the recent mongrel Japanese that ape them. Let them seek beauty of petal and form and color, and see that the schedules of shows are no longer drawn up by ignorant and tasteless persons, such as those who too often prepare them. For instance, few local shows offer any prizes for the beautiful single chrysanthemums.

There is another point in connection with chrysanthemums. Why should we be driven to have plants like broomsticks with a flower or two at the top? Is that the sort of plant that you see on the vases, the fans, or the screens of Japan? Is size or is beauty the object we should aim at in floriculture? Would a six feet high plant with one flower at the end as big as a cabbage give us as much pleasure as a short plant covered, as it naturally would be, with full blown and partially expanded flowers, buds and foliage? These questions answer themselves.—*J. R., in London Garden.*

New Carnations.

Mr. Fred Dorner, La Fayette, Ind., sends us a box of blooms of seedling carnations, and every one is of decided excellence.

Ben Hur is $2\frac{1}{2}$ inches in diameter, has a solid calyx and is borne on stout stem clothed with strong, handsome foliage. The color is bluish pink, a shade which should make it a seller as a cut flower.

Mrs. Harrison is a white variety which will make the now favorite whites hustle to maintain their position. In size it is as large as Ben Hur, a full handsomely formed flower, with solid calyx and good stem.

No. 34 is a remarkably handsome shade of deep rose pink and possesses all the qualities of a first-class flower.

Hoosier is deeper in shade than the foregoing, and such flowers as are now before us would gladden the heart of the retailer. Such large, handsome, solid flowers on such strong stems are not often seen, and these characteristics are just what we want in a cut flower.

Teumisch is a rich crimson in shade, but the flower before us is rather past its best, and we hesitate to pass an opinion upon it in its present condition.

No. 4 is in the way of Hoosier though of a darker shade.

Indiana is a large, well formed flower of mixed shades of carmine and light pink, and while the raiser has named it

after his state it strikes us as the least valuable of any in the collection.

Certainly we are rejoiced that American florists are obtaining such excellent results from their efforts to improve florists' flowers, and we trust that we may be privileged to record many such successful efforts in the near future. We are informed that Mr. Dorner has worked very systematically, keeping a record of each cross, so that he is enabled to name the parents of each of his seedlings.

CARNATION LIZZIE MCGOWAN.—We have received a dozen blooms of this new white carnation from the raiser, Mr. John McGowan, Orange, N. J. The flowers are of good size, well formed and that the variety possesses merit there is little doubt. Mr. McGowan states that the plant is very similar in habit to the old DeGraw, and the flowers are certainly superior to those of that good old sort.

CARNATION LUCIA.—This is a seedling raised by Mr. F. Timme, Irving Park, Ill. It strongly resembles Garfield but as seen recently it may be considered an improvement on that excellent sort.

BEST SIX CARNATIONS.—Will some one please name the best six cut flower carnations for a beginner? W. C.

Seasonable Notes.

Now that the holidays are past growers will have more time to calculate on the merits of the different varieties they have been growing and be able to judge which are the most suitable and profitable kinds to grow, and bend their energies accordingly. While some varieties may be more suitable to certain soils or locations than others, still all the varieties can be grown in any good soil, providing they get the attention and good houses necessary for the same. It seems hardly necessary to repeat the same words so often, yet scarcely a day passes but we hear of some one failing with certain kinds, and if the cause is traced down to its foundation the reason for failure appears very simple. Still they persist in inviting failure by the very treatment given to the plants and there are so many ways to do this that it's not surprising after all. One will give a heavy mulching of green or almost green manure, then wash its strength down to the roots by a liberal watering and shortly after will wonder what can possibly be the matter with his roses. Another will keep the houses at an unreasonably high temperature night and day till almost roasting the plants, they fail to produce any more roses. What can be the matter with them? Is the cry from that quarter. And so we might go on enumerating many and various forms of complaints. But if we could only get the poor plants themselves to give us a version from many quarters what a cry would be sent up, and many of us growers would come in for a very heavy share of abuse.

I often think on reading accounts of what the society for the prevention of cruelty to animals is doing, that a similar society for prevention of cruelty to plants would be a good thing, and perhaps

would work some reform in that line. In my younger days in several establishments with which I was quite familiar they had greenhouses specially set apart as hospitals for all invalids, though in some cases the treatment the poor plants received in them was as much contrary to their wants as some animal patients get at our modern hospitals. Still the idea is a good one to put into practice and if we would set about it I think we should with our present system of growing plants have more than an abundance of applicants for treatment at all times. One of the worst diseases that modern physicians have to contend with is "delirium tremens," and I think there is more trouble with rose growing to-day from the same causes which produce that disease than any other one class of treatment. This no doubt will look like an absurd thing to say, yet it is an absolute fact, and the sooner this matter is thought out in a practical common sense way and our system of cultivation changed to a more rational one, the better it will be for the poor roses as well as their owners and there will then be much less need of my repeating the same thing in one way or another till, as I have no doubt, many of your readers at the present time think me a crank on this subject. Well, my only excuse is a plea for the poor plants and a love of one of nature's grandest if not the finest of all flowers, the beautiful rose.

JOHN N. MAY.

Notes on New Roses.

BY A. E. WHITTELL.

At present there does not appear to be anything like unanimity of sentiment concerning the new roses—extensively grown this winter—Souvenir de Wootton, Duchess of Albany and Mme. Hoste. Hardly one of the retailers spoken to have much to say in favor of the Duchess. A general preference for La France, because of its brighter appearance. The Duchess was seen in November growing at three or four places, but in no case was the rose in good condition; flowers smaller than La France, the growth weak, any quantity of black spot upon it. One retailer prefers the rose because its color does not fade after it is cut, like La France.

Souvenir de Wootton has disappointed both grower and retailer so far this fall. Mr. Robt. Craig has a large number planted out on benches in his greenhouses, but not a flower could be seen that was the equal of a Bennett. Color anything but remarkable. Yet Mr. Evans of Philadelphia, stated that some buds of this variety were sold in his store the previous winter for Beauties, neither the buyer nor the salesman being aware of the difference. It is claimed for this rose that it is free from black spot, but the proof is not according to the statement, for in every place where it was seen growing the disease was present.

Neither was Mme. Hoste seen in good form. This rose, so far with us, has been entirely free from black spot or mildew. The blossoms produced are very unequal. Some no larger than a poor Perle, others on the contrary, as large as well grown Nels—also having the advantage of long, stiff stems and luxuriant foliage. If this rose is wanted in its best form, quantity of bloom should not be sought for. The small buds should be picked off and only those on the strong shoots allowed to remain. It is a free grower and from present appearances is a rose that will prove an acquisition to the limited number of good roses for winter blooming.

It takes, however, two or three seasons

CHRYSANthemUM MRS. BENJ. HARRISON.

before all the good or bad qualities of a rose are discovered. If we find that good flowers are produced by one man, others will soon find a way to have them likewise. But it is certainly a question to puzzle some of us, why so many Woottons and Hostes should present such a miserable appearance when, according to past recommendations, these roses should begin to show beauty and size. Evidently ample opportunity for experiment. Albany, N. Y.

[In response to a query Mr. Craig writes: "The Woottons have been rather disappointing all through the fall, but I am satisfied they will be good the latter part of this month (December) and for the balance of the winter. They are already making much better bloom than a month ago."

The rose was certainly fine as grown by Messrs. C. Strauss & Co. at Washington, during January, February and March last, and the photo-process engraving published in last issue would indicate that it is still doing exceedingly well there. The Wootton is not a good fall rose, but is best in winter and spring. It will bring only the price of a Perle in fall, but in winter twice as much, and is therefore on the whole a more profitable rose than the Perle, at least this is the experience of several large growers.

We have seen some grand blooms of Duchess of Albany and have heard retail flower buyers express a decided preference for them over La France. It is only through information from a variety of sources that we can even approximately determine the value of any rose, but from

what we have seen and heard of both these roses we are very favorably impressed with their value. They may prove to be of no value whatever in some localities, but we should be loth to discard either of these without a most thorough trial, for that they are doing exceedingly well in some places is conclusively proven.—Ed.]

Quassia for Rosebugs.

During this summer and fall I found my roses, and especially the Perles, were being quite badly injured by the rosebug. After trying hand picking for a time I thought I would try what effect a decoction of quassia chips would have upon them. Some time in October I prepared some quassia tea, by putting two or three handfuls of quassia chips in a pail of hot water, letting it stand until morning, then giving the plants a thorough wetting with a syringe. I have examined the plants several times and do not find a bug upon them. Not knowing much about their habits I cannot say what has become of them, they may have hid themselves away for the winter, and in the spring appear in larger and stronger forces. Those who have had experience with them can tell if they are daily workers the year round, or if they appear for only a part of the year, disappear for a time, and then come again when their season arrives. This much I do know, I gave the plants a good syringing with the quassia decoction and the rosebugs have disappeared. If the quassia killed them it is of much value to florists growing roses, and I hope others who are suf-

fering from the ravages of the rosebug will try the remedy and report in the FLORIST their experience. No patent applied for.

Hudson, N. Y.

E. HOLLEV.

ROSE "THE RAINBOW."—Mr. John H. Sievers, San Francisco, Cal., sends us a few specimen blooms of his new rose "The Rainbow." As will be readily imagined the blooms were not in very good condition after a shipment by mail from the Pacific coast, but the marking upon the petals as described could be seen and a strong Gontier fragrance was perceptible.

BEST SIX ROSES.—Will some one please name the best six cut flower roses for a beginner?
W. C.

Chrysanthemum Mrs. Benj. Harrison.

The chrysanthemum represented in the cut was raised by Mr. Geo. Hollis, of South Weymouth, Mass. It was awarded a first class certificate of merit by the Mass. Hort. Society in 1888, and blooms of it were shown at this year's exhibition measuring $7\frac{1}{2}$ inches in diameter. It is thus described: "Pearl white, the inner petals slightly flushed with straw color. Petals broad, outer ones reflexed, gradually incurving to the center, making a broad high flower of great substance."

The "Spider Lily."

I notice in the last number of the FLORIST an inquiry from Chas. H. Mayer, of Waco, Texas, regarding the so-called "Spider Lily." From his description he undoubtedly means the *Pancratium rotatum*, which grows abundantly in the mountains of Tennessee and is locally known by a variety of names. I first heard of it under the name of "Spirit Lily," and certainly its delicate texture would warrant the name. The cup is pure white and from it sprays tapelike petals, which has also given it the name of "Tape Lily." In another locality it is called "Railroad lily," from the fact of its being found abundantly along the cross ties in mountainous regions. At this same place it is also dubbed by the natives "Crow pizen," and there is still another name. In General Andrew Jackson's beautiful garden at the Hermitage, where hyacinths, tulips, peonies, lily of the valley, white lilies and other bulbs and shrubs bloom abundantly, it is most luxuriant and is called by Col. Jackson, who now lives there and who had the name from General Jackson's time, the "August Lily." Its favorite blooming time is August and coming when there are few other lilies is especially desirable.

Your correspondent's mistake is in moving his bulb too often. It is perfectly hardy in this climate or in his and should be left in one spot to spread out its roots deep into the earth. It will then flower abundantly. G. W. CURREY & CO., Nashville, Tenn.

—The "Spider Lily" enquired about by C. H. Mayer, of Waco, is the *Pancratium caribaeum*. It flowers well with us here. HAGGAR & DAVIS.

Marshall, Texas.

—In answer to C. H. M., there is a plant known all through our part of the country as "Spider Lily." *Pancratium rotatum* the botanist calls it. It is a large white bulb, not unlike an onion in shape, throws up the leaves as he describes and in latter part of July or early in August sends up flower stems 12 to 18 inches long full of buds. The flowers are white and very sweet. Our section is full of it. One natural bed not a mile from

me is 40 yards square and thickly set with it. In August the fragrance is noticeable one fourth mile away and if you go to it you can hardly breathe for the sweet strong odor given off. Mr. Mayer has no doubt one large bulb with five to twenty smaller ones. If he will remove it, give leaf mould and cow manure, keep partly shaded and rather moist he will have bloom and fragrance. It is worthy more attention than it gets.

Cloverport, Ky.

FLORIST.

—This is very likely a provincial name given to *Pancratium maritimum*, the sea daffodil of the sandy coast of the Mediterranean. Its flowers are pure white and delightfully fragrant, and the petals are extended in five long thin strips resembling the legs of a spider. It is an evergreen bulb and does best with bench treatment. It blooms with us twice a year, namely in May and December. We do not find that resting is of any benefit to it.

J. A. BALMER.

Vincennes, Ind.

—The "Spider Lily" of C. H. Mayer is probably a *pancratium*. The various species are called "Spider Lily" all through the south. If the soil does not freeze too deep and too long at a time it would be better not to disturb it. A mulch in cold weather would help.

Switzerland, Fla.

W. C. STEELE.

THE NEW TRADE DIRECTORY will be ready by the 10th inst and orders should be sent in at once. The price of the new book is \$2, and it is worth many times that price to any one who desires an accurate list of those in the trade in the United States and Canada.

Orchids as Cut Flowers.

Two years ago I predicted a future for the orchid flowers which would astonish the most sanguine anti-orchidist, and that prediction I find rapidly being fulfilled. In every floral "event" we find the orchid plays its part, not to the detriment of other flowers, but as a great auxiliary to their success. And I feel free to say that in some cases many visitors are enticed to Floral Hall chiefly to see the "orchid flower," as it would not sound well in this enlightened era "not to have seen an orchid." I am often asked how my orchids pay. This would be a pretty knotty question to unravel in many branches of floriculture, as so much depends upon fluctuation of prices occasioned by the ever regulating process of supply and demand, the difference in having success in cultivation and other contingencies incident to every branch of same. For instance, one may have a splendid lot of young palms clean and healthy on September 1, but by December 1 they may be all covered with spot or rust, of course this is produced through neglect and want of proper care, so palms can not pay in this way. The same thing will happen perhaps with roses, violets or carnations, all this is not the fault of the plants, but of the man that handles them. In our perigrinations through the different horticultural establishments throughout the country this unfortunate spectacle is often met with in orchids as other plants, and it is my candid advice to let alone all plants of every description

that is any way foreign to your acquaintance unless you resolutely make up your mind to succeed.

The culture of the orchid does not require anything like the vigilance to handle as do many of our more common things, such as the chrysanthemum, rose, violet, etc. Many of the most beautiful types of orchids will simply grow under the most trying and adverse conditions. For instance, last summer I hung in my carnation house from March 1 till September a row of *L. anceps* close under unshaded glass, the thermometer ranging from 80 to 120. In the evening they were copiously watered, and often in the morning at 5 o'clock they would receive a like drenching. They are to-day full of blooming spikes and will soon be in bloom. *Cypripedium insigne* I had in a frame unshaded outdoors with sun pouring on them till 11 to 12 a. m., in September they looked a little light in color, but to-day they are a beautiful dark green, strong leaves, thick in texture and showing an extraordinary crop of flowers. They have had nothing by way of stimulant, for the reason I think that stimulating the orchid with manure water may produce large thrifty growth, often at the expense of both the plant and flower. I think fairly liberal culture is much safer than high-pressure methods for orchids in general. Strong sturdy growth is much better than hasty growth and large sappy bulbs that will rot, and bluish in two or three nights of fall weather without artificial heat.

Referring to the question do they pay, I emphatically say yes, if properly handled and enough of the right kinds grown to be able at all times in their season to supply orders as they come in. Now regarding the kinds that will pay I should not recommend varieties that are not admired by people of judgment and good taste. Neither should I recommend the varieties which take up large and valuable space, large pots, etc. I mean such plants as *Phaius grandiflora*, *Sobralia macrantha*, *Zygopetalum Mackayi*, *Z. crinitum*, *cymbidiums*, *peristerias*, some of the *lycaests* such as *Deppi*, *gigantea*, *plana*, *thuias*, *cypripediums*, *stanhopeas*, etc. The flowers of this lot, although well enough in their place, can not be grown profitably, and if I grew only such as these I should have to keep them myself, as I can not sell them to ladies of taste, and if I send them to florists they send me invariably a reminder in their next order not to put in any of "those darn'd stiff looking things, as they are neither graceful nor beautiful. Send me all the *odontoglossums*, *phalenopsis*, *cattleyas*, *dendrobiums*, *serides* and *lucy cypripediums* you can." Then just look at the space a large pot of *zygopetalum* or *cymbidium* will take up—say a 12-inch pot or pan—and each pot will not produce more than about three spikes of twelve flowers each, value \$3, when in the same space can be grown at least six pots of *odontoglossums* that will produce six spikes of flowers at \$1.25 to \$2 each, or on the six spikes you can depend upon getting \$7.50. Plants much easier to handle, eminently beautiful and profitable.

While I have thus far intruded upon your valuable space perhaps you will endure a still further infliction, which I will make in giving a brief note on the culture of the leading varieties, commencing with the *cattleya*. Look out for scale, keep sufficient moisture in house when firing hard, increase the light by cleaning glass, give ventilation through bottom ventilators every day (without draught on the plants), do not water the plants till dry and then on fine sunny days water

through pots thoroughly. Place all plants that are finishing their growth in a light position; look out for snails; meal put around the house is an excellent trap and will soon rid the house; a few pots with dry sphagnum laid on their sides between the other pots will soon catch all the wood lice that feed on the roots of the *cattleya*.

Dendrobium Wardianum and *nobile* when ripening off stop watering as soon as bulb is plump, hang in cool, dry atmosphere with plenty of light, and as soon as you find the buds protruding the 16th of an inch put into stove heat with 65° to 75°, plenty of atmospheric moisture, and in about twenty days they will be finely in bloom.

Look carefully over *Odontoglossum Pescatorei* and fall blooming *O. crispum* and as you discover the buds at base of the newly finished bulbs give the plants a little elevation and extra light, water rather more sparingly and you will save many beautiful spikes that if left alone would become food for small snails, etc. After flowering give the plants the coldest place you have in your cold house, 40° till spring comes, when they will begin to push growth again. Water sparingly when resting, but never allow them to become "killing dry." *O. grande* should now have a long rest at 50° till signs of growth commences, when they will require a little mending up or perhaps a repotting. Insley will take same treatment.

Lycaeste Skinneri that are finishing their growth will be better removed from cold house to intermediate, 55° to 65°, they will finish their bulbs better and produce finer flowers and come into use in the holiday season. After growth is finished they may be kept dryer and cooler.

Laelias should be given plenty of light and when out of bloom they may be removed to a cooler house till the flowers are used, rest them in some cool house till season of growth commences, which is late in spring. During this resting period do not water more than enough to keep from shrivelling.

O. Bowringiana are now finishing bulbs and should have 55° to 65° till the bulbs are fully formed and ripe. Rest in cooler house, keeping drier than for *O. crispum* or *Pescatorei*. Same rule will apply to all this tribe of *odontoglossums* such as *vexillarium*, *hastatum*, *citrosimum*, etc.

Cypripediums are growing fast and will require water constantly, in fact they never seem to be at rest. I think though that in large specimens it is well to give a few weeks rest after flowering, as I believe the plant will make better progress than if kept continually watered.

My experience teaches me that the greatest art in orchid culture is to know when to rest them. They will show you when they are anxious to grow. Many of them will stand resting in a cool dry house, viz.: *Dendrobium nobile*, *Wardianum*, *thrysiiforme*, etc., *Laelia autumnalis*, *L. albidia*, *L. anceps*, *Cymbidium eburneum*, *Cym. Lowi*, *C. Mastersi*, *Zygopetalum Mackayi*, *Z. crinitum*, *cypripediums*, etc., but the same plants when growing will take strong moist heat, 75° to 90° when growing, and during that period should be watered freely at least two or three times daily, at the same time giving plenty of ventilation top and bottom.

About the profit in orchids I will say that I consider *laelias*, *cattleyas*, *odontoglossums*, some of the *dendrobies*, *cypripediums* and *oncidiums* such as *varicosum*, *tigrinum*, *crispum*, *Cavendishianum* and some others as profitable as any plant grown provided that they are suc-

cessfully treated, and enough grown to have enough flowers at any time in their season to supply a basket of flowers or a box of cut flowers as the case may demand. And I firmly believe that every florist will find the need of a collection suitable to the amount of trade he does; this need will be brought about by the advancement of taste, which now almost seems inborn in the masses.

Utica, N. Y.

WM. MATTHEWS.

OBITUARY.

JOHN HENDERSON—After a long and painful illness John Henderson passed away on Tuesday, December 17, the immediate cause of death being heart failure. With him horticulture loses one of its noblest representatives, loved and honored by all who enjoyed the privilege of his friendship as a Christian and a gentleman.

Mr. Henderson was born in London, England, December 5, 1818, where he received a classical education, taking a prize in Greek scholarship at the age of 15. He came to America in 1836, and settled in Flushing, L. I., which continued to be his home until 1888. He soon became an authority in horticulture, making a specialty of roses, and is also author of a standard work on grasses. He delivered the first horticultural lecture ever given in the Cooper Institute, for which he received a silver medal. He was a life member of the New York Horticultural Society and the American Institute, constantly officiating as judge at the exhibitions of both bodies, and was also prominent in the Society of American Florists and Nurserymen's Association. He retired from active business last year, taking a long trip to the Pacific Coast for the benefit of his health, which was far from robust at the time. On his return he moved to Brooklyn, where he resided until his death.

During his long residence in Flushing Mr. Henderson was identified with all public and philanthropic work. The Flushing Hospital, close to his nursery, is a monument to his benevolence, he having largely endowed it, and given the land on which it stands. He was president of the electric railway and vice-president of the Flushing Savings Bank.

Mr. Henderson was an accomplished linguist, speaking four modern languages with fluency, apart from his acquaintance with the classics. He made frequent trips abroad, both to the Continent and to his home country, for which he always felt a warm regard.

Mr. Henderson was naturally a prominent figure at all horticultural gatherings in and around New York. His slight figure and calm benevolent face, framed in silvery hair, was always greeted with affectionate good will, and his suave dignity of manner and unvarying courtesy gained him the respect and regard of all who met him. He was a perfect gentleman of the old school, genial, upright and brave with the courage of his convictions. He leaves a widow and two daughters. The funeral took place on December 20, at the Church of the Good Shepherd, Brooklyn.

—Mr. John Henderson died at his residence in Brooklyn on Tuesday, the 17th inst., at the ripe age of 72. He was born in London, England, and came to this country some 33 years ago with a few hundred dollars in his pocket, the remnant of a large fortune lost in a disastrous business enterprise. He came to Jersey City and began business in a small way in forcing the finer kinds of vegetables for

the New York market, a business of which he knew nothing, but his energy and strong common sense soon enabled him to equal and surpass most of his contemporaries. He gradually drifted from this business to that of florist where he was more at home, for his early training in his father's firm of E. G. Henderson & Sons, Wellington Road, London, had made him an adept in all florist operations, so that by the time he had been in business five years he became noted as growing the best plants and flowers sent into the city of New York. Probably no man ever lived who saw quicker the way to develop the best qualities of plants than our old friend. He not only originated many varieties and developed the merits of others, but many valuable methods of culture were evolved from his close observation and fertile brain from which hundreds of your readers are now reaping the benefit without knowing to whom they were first indebted for such knowledge.

Although like most business men, he had reverses, yet he successfully weathered them all, and two years ago, having amassed a fortune, he sold out his immense rose growing establishment in Flushing, N. Y., to his manager, Mr. Chas. Anderson. He had reason to look forward to some years of leisure after his long period of hard work, as he came from an unusually long-lived race, but "Man proposes and God disposes," and he went (as most of us thought) before his time, over to "the great majority."

As a man, no one stood higher, or gave a greater dignity to our profession than John Henderson. He combined the educated, polished gentleman with the strong practical sense of a business man. Modest and unassuming to a fault, there are few men whose memory will be longer revered than that of our friend, who has just passed away.

December 21, 1889.

Washington.

Of late a decided innovation and effective novelty has been introduced in the line of table floral decoration at some of the larger dinners given in honor of the members of the International Maritime Congress and the Three Americas Conference.

Among these the table set recently at the "Arlington" was pre-eminently a success. All set pieces were dispensed with. The table was unique in form and the arrangement was certainly highly pleasing. Seventy guests were provided for. The space allotted to each guest was ample. The linen, plate, China and glass were of the finest and the floral artist capped the climax of effective display without in the least impeding a vision of all parts of the table. A border of about 20 inches of the table covered with white linen was allotted for dishes, viands, fruits, etc. tastefully arranged; then followed an inner border of 12 inches covered with olive colored plush—upon this extending around the whole table but made up in sections—of six to ten feet were flat ivy covered strips 10 inches wide in and upon which were imbedded rose buds in clusters and various other border designs, each section presenting something different, the one being made up of Perles, another of Jacqs and Niphetos, another of La France, etc., not massed designs, but designs rather in groups and garlands, imparting more effect than closely packed buds. The inner court of the table was so sunk and arranged that the crowns of the Maiden-hair and other potted ferns with an

occasional delicate palm, formed a billowy surface on a level with the table top. In this billowy surface liberally, but not too much so, were placed clusters of *American Beauty*, of *La France* and of the new rose, *Duchess of Albany*, loosely arranged in unseen vases so that the crown of the clusters formed as it were charming mounds throughout the extent of the undulating delicate surface of green. Palms of all sizes and of great variety were disposed so as to form a semi-circular tropical background of rare beauty and effectiveness.

A few weeks ago on the occasion of a dinner given by Secretary Blaine at the "Normandie," the table was similarly arranged as to floral decorations; only its form being an ellipse. The space in the center allotted to the florist's art was 38 feet long by 8 feet wide, which required over six hundred potted ferns to fill, but the effect, if anything, was decidedly greater, as no candelabras were used, but in place thereof 150 incandescent and shaded electric lights were introduced beneath the crowns of the ferns, affording ample light, obviating all other means of lighting and producing a mellowness of light throughout the apartment never heretofore attained. In fact one of the distinguished guests remarked that he had been dining now for 35 years in every quarter of the globe, but never had seen a dinner table so effectively arranged. J. H. Small & Sons were the floral artists and designers in both instances. Z.

Chicago.

Passed through the city recently: H. A. Siebrecht, New York; M. A. Hunt, Terre Haute, Ind.; E. G. Hill, Richmond, Ind.; H. A. Bunyard, with Pitcher & Manda, Short Hills, N. J.; E. D. Sturtevant, Bordentown, N. J.; James Currie, Milwaukee.

The Christmas trade was larger than ever before.

The old mistake of holding back stock for the Christmas trade was made by many growers for this market. For two weeks previous to Christmas flowers were very scarce and it was difficult to obtain a fair supply even at high prices. Ten days before Christmas carnations sold as high as \$5 a hundred and a sufficient supply could not be secured at that rate, but on the 23d and 24th great quantities were poured into the market, with the result that many were lost or sold at low prices, for retailers had in many cases ordered from the east, fearing that a supply was not to be had at home, and commission men had refused to accept orders, having every reason to believe that they could not fill them. At the last moment orders, which had the day before been refused, would have been gladly accepted by both retailer and commission man, but it was then too late to let buyers know that their orders could be filled. It seems strange that this same error should be made nearly every year, and that holiday prices should be refused prior to that time.

M. F. Kyle & Son have succeeded Alired Edler at 208 North State street.

Rubber Packing.

I have never used prepared rubber packing, but if T. E. wants a good economical packing for hot water pipes he can utilize his old garden hose by splitting it into quarters and driving the strips into the joints firmly, without cement. If the strips are too thick divide again by splitting the ply. Drive the joint full and you will have a flexible joint that will not go back on you. W. W. S.

The Ginkgo Tree.

The Ginkgo or Maidenhair tree (*Ginkgo biloba* or *Salisburia adiantifolia*) is a beautiful ornamental tree for the garden or street, an admirable avenue tree and of the most distinct and striking appearance. It is perfectly hardy around New York, hardy too at Boston, and luxuriates towards the south. It is a clean and thrifty grower, not over-particular as to soil, insect-vermin proof so far as I have seen, readily propagated and may be transplanted with the greatest success.

It is a supposed native of Northern China, but it has been found wild nowhere on earth. It is extensively planted about temples and palaces in China, and has been cultivated in Japan from time immemorial. The Chinese name for it is Ginkgo, and the Japanese name *Itcho*.

Although much unlike coniferous plants in general contour, it nevertheless belongs to the Yew tribe of the coniferous family. In China it attains a height of 75 to 100 feet, but in this country our largest plants are only about 50 feet high. It is a deciduous tree with broad fan-shaped leaves notched at the end, and not unlike a leaflet of Maidenhair fern, hence the common name. The flowers are small, inconspicuous and green, and the pistillate and staminate ones are produced on different trees. The fruit is an ovate plum-like drupe nearly an inch in diameter and containing a kernel like a small filbert; the color is yellowish green and the flesh juicy, sweet, pucky and malodorous, indeed, a combination not unlike green gage, alum and assafetida.

The first tree planted in this country is still growing in Woodlands cemetery, and is a fine specimen and one of the arboreal treasures of Philadelphia. But it is a male tree, hence has never fruited. Of recent years, however, a good many female trees have fruited especially around Philadelphia. In the Philadelphia *Ledger* a few weeks ago, apropos of the fruiting of the Ginkgo in Mr. C. J. Wister's garden at Germantown, a lengthy and excellent article appeared descriptive of the history of the tree. Mr. Wister informs me that this tree is 45 years old, 40 feet high, 30 feet in spread of branches and 6 feet in circumference of trunk near the ground, and that it has fruited abundantly for the past three years. Mr. Joseph Meacham tells me that five years ago D. Landreth & Son exhibited fruit from a tree on their grounds at Bristol, Pa., and regarding a tree on the grounds of Mr. B. H. Shoemaker, of Germantown, he writes: "I saw a branch about 4 feet long with 46 fruit on it this fall." Mr. S. has two Ginkgos in his garden, a male and female. They were planted in 1866, and are now about 50 feet high with a stem 12 inches through, also—"I thought the land three years ago, at which time, since then, and this year the limbs are crowded with fruit." Mr. S. Parsons, superintendent of the New York parks, writes me: "The Ginkgo biloba in the park (Central) near the lake, * * * has fruited abundantly for the past three years, and so far as I can learn for several previously. It is from 40 to 50 feet high and from 15 to 17 inches in diameter of stem."

The *Ledger* says: "The Ginkgo, of all other trees, is able to resist carbonic acid, sulphuric acid, or any other gaseous element that may permeate the atmosphere of cities, and which renders the health of the modern trees so precarious. The Ginkgo tree is, in fact, found to be an absolutely smoke-resisting tree." Regarding Mr. Wm. Hamilton, superintendent of Public Parks, Allegheny, Pa., (until a few years ago when natural gas dis-

placed soft coal, one of the smokiest cities in the country), writes me: "The Ginkgo has always done well here. The best recommendation that I can give it is, that it thrives as well in a smoky atmosphere as the *Ailantus*."

According to Mr. Andrew S. Fuller it is "propagated by seeds imported from Oriental countries, by layers and cuttings of the young shoots taken off with a heel in midsummer, or of the ripened twigs in autumn, and planted in frames in a greenhouse. * * * or varieties by grafting in the open air early in spring, or under glass in August."

Some florists, especially those who do a mail trade, sell a large number of Ginkgo trees every year. They usually buy one year old seedlings in France; these are quite small and of handy mailing size, but there is no reason whatever why they shouldn't raise their own plants and keep the money at home which they send to Europe.

There are several forms of the Ginkgo, for instance, large leaved, small leaved, deeply notched leaved, and variegated leaved. But the variegation is not present all over the tree, it merely occurs in a bud or twig here and there. And we have pyramidal and spreading forms. But, really, the varieties are nothing more marked than you can pick up in a bed of seedlings any day.

WM. FALCONER.

SPRINGFIELD, MASS.—The Gale Floral Co. has opened a store at 331 Main St.

SEATTLE, WASH.—C. Hoffmeyer, for ten years with J. R. & A. Murdoch, of Pittsburg, and later with the Soldiers' Orphans' Home at Uniontown, Pa., has started into business in this city.

BELLEVUE, PA.—The greenhouses which were burned December 1 were owned by James Crawford and operated by John Lutz. They were not the houses owned by Fred Burki as announced in last issue.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED.—With seed or florists' supply house. Salary or commission.

A. RINGIER, care American Florist, Chicago.

SITUATION WANTED.—By a young man to make up, store or greenhouse, 8 years experience to Boston. Address FLORIST, care F. A. Hogan, 222 Fayette St., 17th Mass.

SITUATION WANTED.—As manager or foreman to a large commercial or private place, 15 years experience in the best known nurseries of England, Belgium, Germany and America. Thorough knowledge of all branches, would like to go on half shares. F. care American Florist.

WANTED.—An industrious young florist for general greenhouse work. Address H. KADEN, Gainesville, Texas.

WANTED.—Commercial florist; single man. For full particulars, address R. SCHAFER, 116 Denham Street, Cincinnati, Ohio.

WANTED.—Landscape and vegetable gardener; strong, industrious, sober and sensible man. Address E. T. NOEL, Nashville, Tenn.

WANTED.—A florist that understands the propagation of roses, one that is willing to work and make himself useful can get a good situation. Will pay wages or give me half interest in the business. Address H. G. CARTER, Shreveport, La.

WANTED.—A partner; must have commercial and practical experience in propagation. First-class facilities and good trade, can be indefinitely increased. Must take some money interest to insure reliability. 12,000 feet of glass, 2 acres ground, steam complete. Address CARNELL, care American Florist, Chicago.

WANTED TO RENT.—Not less than 100 running feet of glass, and not less than 1 acre of land adjoining, within 20 miles of New York City—a fashionably populated neighborhood—preferred or would manage a good commercial business if could come to terms with parties for the introduction of a lovely class of plants destined to have a great future in advertising possessing the most magnificent stock in America, without exception, and is an expert in the growing of same. Stock sufficient to grow 100,000, is also an expert in the growing of greenhouse

grapes, chrysanthemums, tomatoes and mushrooms to winter. This is genuine. Address Box No. 1, Scarisford, Westchester Co., N. Y.

FOR SALE.—A \$5,000 business on easy terms. For particulars, address X, care American Florist.

FOR SALE.—In a prospering New England town, a commercial greenhouse with large dwelling and outbuildings, all new. For particulars address C. EVERDING, Bradford, Conn.

FOR SALE.—A valuable property in a thriving town in Western New York, 200 feet of glass, well stocked with roses and carnations, and all plants, excellent shipping facilities. Particulars and reasons for selling by addressing S, care American Florist.

FOR SALE.—If I can sell in the next fifteen days, I will for sale a new, paying business, three greenhouses 12x30, water heating, fine stock of plants and the hydrant, dwelling house with four rooms, stable, hot acre lot, 50x175, one-half lease. No competition. Can give possession at once. Will run it if desired for two months yet. For particulars, apply to M. J. NAGEL, Jefferson City, Mo.

FOR SALE.—A well appointed wholesale florist, a total gross annual sale of \$20,000, all covered with glass, in a lively suburb of New York City. All cut flowers are sold on the premises to truckmen, and orders are filled and delivered. Excellent reasons given for selling. Price, \$30,000, one-third cash, balance on bond and mortgage. For particulars address

THOS. W. WEATHERED'S SONS, 46 and 48 Marion Street, New York City.

FOR SALE.—An established paying nursery and greenhouse business, one of the best in California, root stock, plants, and all accessories subject to purchase. Close to San Francisco, numerous large houses, heated throughout, complete assortment of salable stock, a splendid chance will pay from the first day. Can be purchased with privilege of trial if desired. Any one in want of a fine established business should investigate at once. The best of reasons given for selling. Address for particulars

EMORY E. SMITH, 321 Market St., San Francisco, Cal.

FOR SALE.—Good established florist business near one of the principal thoroughfares of Cincinnati, well known as the best retail stand in Cincinnati, with dwelling house, 6 greenhouses (5 newly rebuilt), the old frame, hotbeds and all accessories at outbuildings. City hydrant convenient to water the whole place. Greenhouses heated partly with fuel and hot water, 1st floor on Cemetery street, with the lawn, trees and shrubs. From 100 to 15,000 people a day were visiting the cemetery this year. Reason for selling, health. For particulars address C. A. PETERS, Florist, Price Hill, Cincinnati, O.

FOR SALE.

Two private greenhouses, heated by Weathered boiler, 30 feet long, span roof and lean-to, in good repair, 100 plants, 2500 roses, 2500 carnations, rent \$50 per year; centrally located, on good street, this city. Address

11 W W, Box 12, P. O., Providence, R. I.

TO FLORISTS AND GARDENERS.

I am about to erect for Rental on the choicest part of Ninth Avenue, N. Y., opposite Mahanata Square and the Museum of Natural History, a store and greenhouse, to be constructed entirely of iron and glass, and of good design.

It will be supplied with steam heat and electric lights, hot and cold water, and fitted with shelving, racks and all modern conveniences.

This is in the best part of the West Side, and is surrounded by high grade dwellings and a wealthy population.

Plans, terms and full particulars can be had by applying to

C. K. BULL, CITY.

62 Liberty St., NEW YORK CITY.
Or the "EVELYN," 101 West 75th Street.

ROSES.

Good strong young 2-inch pot plants at \$30 per 1000; strictly my selection of Teas, Hybrid Teas, and Noisettes, true to name and good varieties, from last summer's propagation.

Gen'l Jacquemont, at \$3 per 100, \$40 per 1000. GERANIUMS.—Good varieties, my selection, at \$30 per 1000. Single and double, Mme. Sallerio, at \$3 per 100. ROSE GERANIUMS, \$3 per 100.

FERNS.—Adiantum uncinatum, and Adiantum Decurrens, from 2-inch pots, at \$3 per 100 plants.

LATANIA BORBINICA.—5-inch pot plants, at \$4 per dozen; 4-inch pot plants, \$3 per dozen.

AMPELOPSIS VEITCHII.—One year old plants, at \$5 per 100.

PRIMROSES.—Single, 4-in. pot plants, \$8 per 100. Obconica, 4-inch pot plants, \$1.50 per dozen.

FUCHSIAS.—Good varieties, 2-in. pots, \$3 per 100. CYTISUS RACEMOSUS.—2-in. pots, at \$3 per 100 plants.

VINCA VARIEGATA.—2-in. pot plants, \$2.25 per 100. HARRISONII, 2-in. pots, \$3 per 100.

PETUNIAS.—Double, 12 varieties, at \$4 per 100.

CUT FLOWER DEPARTMENT.

WOOTTONS.

OUR 20,000 WOOTTON BUSHES WILL BE IN BLOOM AFTER DECEMBER 10th, AND WE CAN THEN FILL ORDERS FOR THE BUDS OF THIS SUPERB RED ROSE IN ANY QUANTITY.

FIRST SIZE blooms frequently excel in size and color the American Beauty, and equal it in perfume.

SECOND SIZE blooms in every way compare favorably with Bennett.

FIVE ACRES OF GLASS containing 80,000 rose bushes grown exclusively for cut flowers. We cut from 10,000 to 25,000 buds per day during the season from December 15th to May 15th.

VARIETIES:

Wootton, Beauty, Puritan, Hoste, Perle, La France, Watteville, Cusin, Bride, Mermet, Gontier.

We also grow large quantities of bulbous flowers, such as Tulips, Roman and Dutch Hyacinths, Narcissus, Lily of the Valley, etc., etc.

Shipments made by United States or Adams Express, or in special cases by Pullman cars. Canadian, North western, South-western and Southern orders specially solicited.

In telegraphing, much expense may be saved by using the **CODE** which we will send on application.

Telephones 977 and 999. **C. STRAUSS & CO., WASHINGTON, D. C.**

P. S.—Messrs. Strauss & Co. are now ready to make contracts to supply any of the above named Roses in 2½ or 3-inch pots, after April 1st, 1890, at very reasonable rates.

IMPORTED H. P. ROSES.

Worked low on the Manetti Stock, offer the best results to the florist, blooming freely and giving plenty of cuttings for propagating quickly. Fine plants for sale by the 100 or 1000, at low rates.

Price Lists to applicants. Address

BEAUTIFUL SHAPED PLANTS. ALL SIZES.

GABRIEL MARC & CO.,
Queens Co. WOODRIDGE, L. I., N. Y.

CALIFORNIA'S NEW ROSE "RAINBOW."

The "RAINBOW" is *The coming Cut Flower Rose*, it is not only handsome, but I do state that it will also be one of the paying roses, ranking with *La France* and *Perle des Jardins*.

MY REASONS FOR IT:

FIRST: Its freedom of bloom surpassing *Papa Gontier*, from which it is a sport, having the same erect habit of growth.

SECOND: Color of the flowers. Imagine a *Papa Gontier* of a lovely pink, blotched and streaked with the darkest Gontier color, at the same time only enough to add to its beauty, with base of petals of a rich amber.

THIRD: Have you any pink rose that is as free a grower, as free from disease, does as well as Gontier in a low temperature and produces its flowers on strong and erect stems?

The "RAINBOW" answers the above description, and has been recognized by the highest award at the recent Fall Exhibition of the California State Floral Society.

The judges in a Special Report to the Society stated as follows:

"We, the undersigned, your COMMITTEE on AWARDS of Prizes for the Fall Exhibition of the California State Floral Society, have carefully examined the new rose "RAINBOW" brought out by John H. Sievers of San Francisco, Cal., and exhibited by him, and we find that this new rose is possessed of unusual merit as to color, form, substance, and its variegation—the latter being very distinct—and award to Mr. Sievers, for the same, the highest premium of the Society—a Silver Cup."

Signed,

JOHN GABLER, B. M. PRATT,
WM. GAUGE, CARL KRUGER,
CHS. SCHUMANN.

The "RAINBOW" originated at my nurseries in the Spring of 1888, and will shortly be offered to the Trade.

Visitors from the East should not fail to call and see for themselves.

Any enquiries and communications in regard to the "RAINBOW" should be directed to my address.

JOHN H. SIEVERS, 25 Post Street,
SAN FRANCISCO, CAL.

Orders for less than one-half inch space not accepted.

Advertisements for January 15 issue must REACH US by noon, Jan. 9. Address

THE AMERICAN FLORIST CO., Chicago.

NOMENCLATURE.

A very severe criticism on the work—or rather lack of work—of the committee on nomenclature appears in another column. However, something was done, though no material results followed. At the meeting of the committee held in New York city last May, as noted in the FLORIST of June 1, the work was divided and sub-committees appointed to collect data regarding the plants in the divisions assigned them. The understanding was that these sub-committees were to report to the full committee at Buffalo the day before the opening of the annual convention, but that meeting was never held, and no reports were made so far as we can learn.

The work of straightening out the tangle in plant names is not going to be easily done. A committee will accomplish little or nothing without the assistance of every one in the trade; and until this assistance is accorded we need not expect any results, no matter how competent the committee may be. If every florist in the land who knows of a case where a plant is traveling under two names would promptly report the same to the proper committee, that body would have something to work upon, and every case reported would we believe be investigated and the result made known to all.

But many of these cases will not be settled off hand. We have yet to meet the man who can at once positively identify every existing variety of the plants in any of the divisions made by the committee. We have heard it said that there were such well informed men, but we have never met them and have small faith that the meeting will ever occur. We mean of course a positive identification which shall be conclusive, and work of this kind must be absolutely accurate or it is worse than useless. We believe that in many cases synonyms may be positively identified only by growing the two sorts side by side for comparison.

THE NATIONAL CHRYSANTHEMUM SOCIETY.

We understand that several firms have imported the same set of chrysanthemums under number and that each firm will in all probability send them out under names of their own. Here is a source of synonyms that should be attended to at once, and that it is a matter to which the National Chrysanthemum Society should turn its attention all day long.

Every one receiving new plants under number and who is not positive that he has the entire stock should notify the president or secretary of the society, giving the names which he proposes to give them. The names first sent in should have priority and those having the same

set and who applied later should be advised of the names already given and be requested to conform to them. Here is an opportunity to secure uniformity in this matter which should not be neglected.

SOMETHING NEW.—Yes we want it. Something new and something better than what we have got, but we believe that many florists are working in the wrong direction. We refer to those who are unsuccessful with many sorts which their neighbors with more careful cultivation do succeed with. We know growers who have never sent out a really first class flower of any kind from their place, and we believe that it will be useless for such to hunt for some better variety until they have improved their methods of culture. We believe that the wait for some new variety which will produce fine marketable blooms under such adverse conditions as those supplied by some shiftless growers will prove such a long one that it will be exceedingly tiresome.

IMPROVED VARIETIES.—We want improved varieties, and the way to get them is to grow them ourselves, and to do that requires careful patient work toward some definite object. In the mean time it is well to bear in mind that the desideratum is *improved* varieties and seedlings which are plainly no better than or not equal to existing sorts should be promptly consigned to the rubbish heap. This reminder would seem unnecessary, but it is a fact that a large number of the flowers of seedlings sent us for notice are inferior to existing varieties of the same color and form, and some of them are so poor that it is a matter of surprise that the grower should ever have for an instant deemed them worthy of a name.

THE IDEAL CHRYSANTHEMUM.—In our English exchanges we note some well made criticisms upon the tendency to make size the main consideration in a chrysanthemum flower. The London *Garden* aptly asks: "Is size or is beauty the object we should aim at in floriculture?" We want flowers of good size, but the huge monstrosities which have been developed in the last few years, have little to recommend them except size. The thought then occurs; what should the ideal chrysanthemum be? What should be the limit of its size? and what are the requirements for an ideal flower? Is not this a matter for the consideration of the National Chrysanthemum Society?

LATE CHRYSANTHEMUMS.—Mr. Arcnd Brandt, Newport, R. I., sends us some good blooms of chrysanthemums. Some specimens of Christmas Eve were especially good. The majority were, however, badly crushed. Those sending flowers should take note that they very rarely reach us in good condition when packed in light pasteboard boxes, as such are almost sure to be crushed in transit.

Catalogues Received.

California Nursery Co., Niles, Cal., nursery stock; W. C. Jenkinson, Natick, Mass., plants and seeds; Hill & Co., Richmond, Ind., new chrysanthemums; Park Nursery Co., Pasadena, Cal., nursery stock; Henry A. Dreer, Philadelphia, flower and vegetable seeds; Gustave Knoderer, Nice, France, seeds and bulbs; D. Landreth & Son, Philadelphia, seeds; E. D. Sturtevant, Bordentown, N. J., rare water lilies; Ludwig Moller, Erfurt, Germany, horticultural books.

Boston Notes.

Violets scarce.

American Beauties ditto.

There are a few scarlet tulips in the market.

Double pink bouvardia seems to "take" this season.

Southern mistletoe has arrived in good condition generally and sold well.

Holly has been in great demand. It has never sold so well in this market.

The executive committee of the Society of American Florists will meet at the Tremont House on January 15. The Boston boys will be glad to see them.

They ought to have a sleigh-ride on the Brighton Road, but unless the present style of weather changes they had better bring their linen dusters along with them.

The program for the January meeting of the Gardeners' and Florists' Club includes an essay on the education of young gardeners, by Prof. B. M. Watson, Jr., of the Bussey Institute.

The delegation of Boston florists who attended the opening of the new reading room and bowling alley of the New Jersey Social Florists' Club met recently and unanimously voted to put on record their appreciation of the kindness received at the hands of Mr. J. N. May and other members of the New Jersey organization, not forgetting the young men of Mr. May's establishment who labored so zealously to make the occasion the great success which it was. The undersigned has been instructed by the Boston party to extend through the columns of the AMERICAN FLORIST their hearty thanks to their big hearted New Jersey friends.

There is another little "Miss" at David Allan's house. W. J. S.

Forcing the Gladiolus.

If W. F. (page 205 FLORIST) would have gladiolus in bloom early in winter he should plant some bulbs about February 1 in open bench or pots, thus getting them in flower about May 1. Ripen the bulbs off slowly, keep them in a cool dry place during summer and start them again about September 1. This will bring them in bloom near Christmas or during early winter. As W. F. says, bulbs grown outdoors during summer will not ripen in time for early forcing, but if he will follow the above directions I think he will meet with success. The best varieties for forcing are La Candeur, Shakespeare, Eugene Scribe, John Bull, Brencleyensis, Isaac Buchanan and Romulus.

Duty on Bulbs, Etc.

Please state whether a duty is charged on bulbs, corms, tubers and roots. I understand some of these come in free, if so, what articles come under the respective designation? It appears some importers have been charged duty on lily of the valley, callas and arums, probably because some appraisers do not know a potato from a tulip.

This is something that would interest many importers and lead to quite an interesting and instructive discussion as to classification. I for one would like to know if there is a duty on arums. Some say there is, others say not. A. B.

[The Florist has found much difficulty in securing definite information on the above, but there is a special treasury decision on lily of the valley. They have been classified in nearly all ports of entry as plants and are not dutiable. The classification of callas, arums, cannas and other bulbs varies according to the notions of appraisers at different ports. For instance, the U. S. appraiser at Chicago classified cannas as bulbs dutiable at 20 per cent. An appeal was made to the Secretary of the Treasury who sustained the decision. A letter was written to the Government Botanist at Washington who reported the canna to be a plant, thus proving that the department had rendered their decision without reference to their own highest authority, although to be found in the same city. There is little comment needed to prove that the tariff and classification as they exist at present need revision.]

Montreal.

The regular monthly meeting of the Florists' and Gardeners' Club was held December 10, there being about fifty members present.

An interesting paper was read by the veteran florist J. S. Murray, (or as he delights to sign himself "Dinna, ye hear it"), upon business methods. It contained some sterling advice to young florists intermixed with several humorous quotations and witty sayings. Hedwelt strongly on the necessity of being economical, and commended the words of the old song "A penny lay bye for a rainy day" to his brother florists.

A useful paper upon "Ornamental trees," by John Walsh, elicited some useful discussion. The two essayists were accorded the hearty thanks of the meeting.

The committee upon the coming spring show announced that the Polman Mooy gold medal would be awarded to the member making the best general display of bulbs in bloom. The silver medal presented by the General Bulb Co., of Holland, will be awarded for the best display of Dutch hyacinths in pots, and the bronze medal presented by the same firm, would be awarded to the private gardener making the best general display of bulbs.

It was also announced that the prize list would be printed and ready for distribution at the semi-monthly meeting. A vote of thanks was tendered to the S. A. F. for a copy of the report of Buffalo meeting.

The following gentlemen were elected

honorary members of the club: Hon. Col. Rhodes, Provincial Minister of Agriculture; Henry Siebrecht, of New Rochelle, N. Y.; Sir Donald Smith, K. C. M. G. There were also two new members enrolled.

The treasurer announced that the prizes for the chrysanthemum show had all been paid, and that there was a handsome balance in the bank.

Joseph Bennett has opened a handsome flower store on St. Catherine street.

The "Wootton" rose is not giving satisfaction here so far, but the "Beauty" is steadily growing in favor. J. McK.

Rubber Packing.

In reply to the query of T. E. in last issue will state that I have used rubber for packing 4-inch hot water pipes, using two to a joint and they gave the best of satisfaction. I consider it far ahead of other methods of packing as the pipes can be easily taken apart at any time without injury. W. C.

500 extra nice SMALL PLANTS for a variety of Cuttings and Small Plants useful in a greenhouse
J. S. WARNER, Medina, Ohio.

To The Horticultural Trades

GREETING.—This is simply to remark that we have cut discounts to Advertising Agents down to a low figure. So if you are placing your order through an agent, you may have to INSIST on his including *The American Garden*, to prevent substitution of a less valuable medium. YOU know well enough that there is NO OTHER WAY so low in cost for the results secured, for reaching the best grade of Horticultural Buyers.

YOU MISSED IT if you did not get your ad. into the January number (now closed) which is to be a great double extra edition, of extra size and numerous illustrations. BUT when you see that number, and reflect that those to come after will be very nearly as good (perhaps better), THEN you will lose no time in forwarding your "copy" for an advertisement.

HUGHES SOLUBLE FIR TREE OIL.

FLORISTS AND NURSERYMEN SHOULD
NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants, such as ferns, etc. If used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

MRS. EVELYN ARNOLD,
GRAND RAPIDS, MICH.

The Public Want

Their seed fresh
and true.
Would they not be most likely to obtain such by buying
directly from the grower? I can buy seed at half
what it costs me to raise it, but could not sleep sound
should I warrant seed of this class. For the same
reason I make special effort to procure seed stock
directly from their originators. You will find in my
new seed catalogue for 1890 (sent free) the usual
extensive collection (with the prices of some kinds lower
than last season) and the really new vegetables
of good promise. You should be able to get from me,
their introducer, good seed of Cory Corn, Miller Melon,
Hubbard Squash, All seasons and Deep Head Cabbages and
many other valuable vegetables, which I have introduced.

JAMES J. H. GREGORY, Marblehead, Mass.

We offer for Spring planting the largest and most
complete general stock in the United States, of
FRUIT and ORNAMENTAL TREES, SHRUBS,

Musa Ensete.

I send with this a photograph of a plant of Musa ensete grown on the grounds of Mr. N. L. Zabriskie.

The seed was planted in March 1886, the first year it was wintered in the greenhouse and last winter in a warm cellar, to which place it was again taken when it was lifted October 20 last. The leaves were all cut off except the center which was not unfurled. When photographed the plant measured over fifteen feet in height and some of the leaves were ten feet long. It was planted last summer in a very rich bed with cannas and given liquid manure twice a week. The leaves of this plant have a crimson midrib and it is more vigorous than the plain green form.

MARTIN C. BECK.

Anrona, N. Y.

[The photograph shows a handsome specimen of this banana growing in the center of a bed of cannas.]

Keeping Down Greenfly.

In the communications you have printed regarding fumigating, etc., I have seen no mention made of what has proved with me the best and cheapest method of keeping down greenfly. Of course it can only be done in this way by those who have hot water pipes under the benches. It is simply to place the tobacco stems on the pipes. I use at the rate of one ton of stems to 10,000 feet of glass, but think less at a time would do as well if the houses were clean of fly to start with. There was a considerable number of them in my houses when the stems were put on but it killed them in two days. After two months trial have yet to see any evil effects. E. H.

NEW AMERICAN CHRYSANTHEMUMS.

HILL & CO.'S SET OF 12 will be ready for delivery March 1st, 1890. These are the products of some of the best raisers in this country. The list includes

HARRY E. WIDENER, winner of the Blanc prize at Philadelphia show.

JOHN LANE, a magnificent pink, raised by W. K. Harris.

MRS. J. K. EMLEN, an improvement over Mrs. A. Carnegie.

CROWN PRINCE, of the Wheeler type, petals ¾-inch in width.

MOLLY BAWN, a pure white sport, from *Syringa*, two years.

CLARA REIMEN, rich lavender rose in color. Certificate of merit.

CARRIE DENNY, clear amber, entirely distinct from anything in cultivation.

MRS. WINTHROP SARGANT, brilliant straw color. Largest in this line of color.

CHARLES A. REESER, rosy pink, with shadings. A fine exhibition plant.

MRS. EDMUND SMITH, a beautiful fine white, of an entirely new type of flower.

ROBERT S. BROWN, four times as large as John Welsh with the same intense color.

MISS MARY WEIGHTMAN, chrome yellow, large flowers, 10 in. in diameter.

Lists on application, with descriptions of the twelve. Orders booked in rotation.

PRICE, PER SET OF TWELVE, \$10.

We have arranged to offer Mr. T. H. Spaulding's new set, also Mr. H. Waterer's new ones for 1890. Same price as the raisers.

REMEMBER THE FINEST CHRYSANTHEMUM OF THE YEAR IS OUR HARRY E. WIDENER.

We shall be pleased to make prices on lists of Chrysanthemums. All the New Prize Winners of this year (1889) in quantity for Jan. delivery.

HILL & CO., Richmond, Ind.

NOVELTIES IN FLOWERS FOR 1890.

OUR NEW SEED ANNUAL

is handsomer this year than ever. All who have not received a copy should send for it at once. Among the many valuable Novelties and Specialties offered and described therein, the following are of great value to florists:

- 1 AULEGIA STUARTI, Dr. Stuart's new Columbine.
- 2 PYRETHRUM ULIGINOSUM, single white. A gem for cutting.
- 3 MYOSOTIS ELEGANTISSIMA, quite distinct, and a great acquisition.
- 4 ROSY MORN POPPY, unique and beautiful.
- 5 KALANCHOE CARNEA, a promising novelty.
- 6 PRIMULA OBCONICA, indispensable for cutting etc.
- 7 DIANTHUS HIDEWIGI, "The Bride," pure white with a velvety purple center.
- 8 NEW ENGLISH PRIMROSE, a select new strain.
- 9 SHIRLEY POPPIES, various colors; distinct and fine.
- 10 HENDER'S PETUNIAS, single, superb in size and color.
- 11 GIANT AMERICAN COWSLIP, (Dodecatheon Clevelandi).
- 12 PEACOCK PANSY, (Carter's new Pansy.)

In order to introduce these sterling novelties to readers of the *FLORIST* we make the following Special Offer: For \$1.75 we will mail free the entire set as described above—one packet of each—the regular price of same taken separately being \$2.55. Or we will mail free numbers 2, 3, 4, 6, 7 and 9 for 70c. Order early, as our stock is very limited on some kinds.

JOHN GARDINER & CO.,

GROWERS, IMPORTERS AND DEALERS IN VEGETABLE, FLOWER AND FARM SEEDS,
Philadelphia, Pa.

VERBENAS! VERBENAS! VERBENAS!
A SPECIALTY.

Having moved our business from Kewanee, Ill., also increased our capacity for growing Verbenas for the trade. We may safely say we have one of the largest and cleanest stocks in the U. S. We don't grow any but the finest Giant and Mammoth strains, with some of the best old sorts. We may remark that this is the second season the Giant set were sent out—only a limited number being sent out last season. For size and brilliancy of color they can't be surpassed. Our potted plants will average five cuttings to the plant. Goods packed light, and safe arrival of same guaranteed.

POT PLANTS, Transplanted, per 100, \$3.00; per 1000, \$25.00.

Variegated Musa Ensete.

In reply to our inquiry concerning the variegated M. ensete, Mr. Frank Goeike, of Kalamazoo, Mich., states that he has "raised them from young sprouts." This plain statement is quite unsatisfactory, and if Mr. Goeike can give through the columns of the Florist full information as to how he obtained the "young sprouts" and from what, it would be most gratefully received by all florists who grow the M. ensete. Mr. B. A. Elliott, of the firm of the B. A. Elliott Co., of Pittsburg, stated in a letter to me that the green M. ensete has never thrown off shoots with them, and they are very large growers of this variety of the musa. There is a plant of the M. ensete in a gentleman's conservatory here in our city that is twenty feet high and has one leaf ten feet long, a very fine specimen and it is old enough to throw off sets if it is ever going to. If there is any way to encourage this variety of the musa to stool it would be valuable information to the trade in general. The Musa Cavendish stools very readily and quite frequently comes with more or less variegation, but no comparison to the sample we sent to the Florist. G. R. CLARK.

Scranton, Pa.

MUSHROOM SPAWN

Best Imported English Milltrack.

Gardiner's Genuine English Milltrack Mushroom Spawn.

John Gardiner & Co. make a specialty of genuine English Milltrack Spawn. Why waste your money on doubtful quality, when you can buy the genuine English Milltrack at a reasonable price?

Can be thoroughly relied on to produce a fine crop of the best Mushrooms. Specially prepared for our trade by one of the most celebrated growers in Worcestershire.

Four importations a season—always fresh and unsurpassed in quality. The price commands itself.

By mail, post-paid, 22 cents per pound; five pounds for \$1.00. By express, at customers' expense, ten pounds for \$1.20; fifty pounds for \$5.00. Write for special prices on large lots.

FRENCH SPAWN.

In 2-lb. boxes, by express, 80 cents; ten boxes \$7.00, twenty-five boxes \$15.00, fifty boxes \$27.50.

NOTE.—For culture of French Mushroom, see pamphlet "Mushroom Culture," by Vilmorin, sent free on application with every order for spawn.

For culture of "English Milltrack" Spawn, see our pamphlet "Mushrooms for the Million," free for stamp with all orders when requested.

THE "PLANET JR"

HORSE HOE has a world-wide fame, and its hosts of friends will be delighted with its improvements for 1890. First LEVER EXPANDERS Instantaneous in action, firm, strong, simple, accurate, perfect. HANDLE ADJUSTMENT Sidewise and for height. Quick, efficient. grand for genies, corn and in covering Standards. Interchangeable. STRONG. PARALLEL FRAME CONVENIENT, immutable. We absolutely guarantee our 1890 Horse Hoe and combinations, and new patented features to please every practical farmer and gardener, and their money value to be far greater than ever. Look at it, and write us. **Catalogue free.** The "PLANET JR." Hand SEED DRILLS, Double and Single Wheel Hoes, "Fire Fly" Plow, &c., are indispensable to farmers and gardeners. They sow with regularity any thick and deep, difficult and easy seeds in small or large quantity, and without danger to vitality and without special care. In market gardening the Wheel Hoes save their cost every two days. The "Fire Fly" Garden Plow is a delight in the family vegetable garden. The "Planet Jr." combined Seed Drill, Wheel Hoe, Cultivator and Plow combines in an admirable way the qualities of all the rest, being delightful as a Seed Drill, Immobile Wheel Hoe while plants are small, Single Wheel Hoe Cultivator—deep or shallow, and Garden Plow. All the blades of these famous hand tools have long been made of hardened polished steel. Keep them bright and sharp, and you will save the full cost every few days. Send for full Descriptive Catalogue of all our goods. Write us your wants. S. L. ALLEN & CO., Sole Mfrs., 1107 Market St., Philadelphia.

This is the cheapest Fertilizer I know of, worth more than ground bone.

J. M. JORDAN, St. Louis, Mo.

Hot Water in 2-inch Pipe.

I would like to ask Mr. E. Holley if he thinks it would pay one who is now using 4-inch pipes to change to 2-inch? It would seem so if 1,000 feet of 2-inch wrought iron pipe will heat the same space as 1,000 feet of 4-inch with the same fire. As the 2-inch pipes contain only one quarter the water contained by the 4-inch it is reasonable to expect that the water in the 2-inch pipes will flow and return four times as fast in the same length of pipe and with the same fire, and with 1-inch pipe sixteen times as fast.

Calculate the number of gallons of water contained in 1,000 feet of 4-inch pipe, the result is startling, being no less a quantity than 543 imperial gallons, or about 700 gallons wine measure. The quantity of water in 4-inch pipe may be ascertained by measuring the length of the pipe and calculating 22 inches for the imperial gallon and 17 inches and a fraction for the wine measure gallon. Even if it would not pay to make the change it is not very satisfactory to find that I am heating four times the quantity of water necessary.

Jas. W. Scott.

Galt, Ont.

PUYALLUP, WASH.—The Puyallup Nursery and Seed Co. succeeds J. M. Ogle, the latter having associated with him Mr. E. S. Swart and adopted the first named firm title.

Read what C. A. Reeser says for our 3-PIECE BOX:

GENTLEMEN:—I write to tell how well pleased I have been with the mailing boxes you have furnished me during the past two years. I think I have ordered 35 or 40 thousand, thus giving them an extensive trial. I think there is nothing in the market that is so satisfactory, at least, that has been my experience, and I have tested nearly, if not quite all the boxes in the market for that purpose.

Yours very truly, C. A. REESER.

ONE OF THE FEATURES of the FLORIST has been its punctuality, being until last issue mailed promptly on time. Our issue for January 1 was, however, two days late, and we feel that an explanation is due our readers. The FLORIST was put to press on time as usual and one form was nearly off when all the press feeders in Chicago went out on a strike, and this was the cause of our failure to reach our readers with our usual promptness. It was one of those things that can not be provided against, and had not the company that does the press work for us finally acceded to the demands of the men we should probably have been still later.

THE HOLIDAY TRADE.

New York.

Opinions differ as to the volume of Christmas trade, but it cannot be considered very lively. The crop marketed was certainly smaller than preceding years, especially roses, yet it was enough to supply the demand. A good many growers held back their stuff, as usual, rushing it in at the last moment, to the exasperation of the commission men. There were few really good roses; a large proportion of Mermets, Perles and Cusins were wretchedly colored, in consequence of the lack of sunlight. Few hybrids were in the market.

Prices of roses were as follows: Beauties \$75 to \$150, Gontier \$10-\$15, Perle \$12-\$15, Niphetos \$12-\$15, Souvenir \$12-\$15, Bride \$25, Mermet \$25, Bennett \$20-\$25, La France \$30-\$35, Magna \$60-\$75, Watteville \$20, Cusin \$20.

It will be observed that these prices differ little from the preceding year; if anything they were higher.

Among orchids, cattleyas sold at fair prices, by the box or spray; of cypridiums there were rather too many. They brought from 16 to 20 cents, which is less than last year, but a great many had been held back and a good many were grown.

Cyclamens brought from \$2.50 to \$3 a 100; this flower had to wait some time before its claims were recognized, but the demand now seems quite steady.

Comparatively few tulips were in at Christmas; they were the scarlet Due Van Thol and brought \$4 to \$6 a 100. Lily of the valley was good at \$8 a 100. Roman hyacinths were \$2, \$3 and \$4 a 100, according to quality; a good deal seemed rather weakly.

Very few lilies were in at \$4 a dozen. Poinsettia sold fairly well at 25 cents; violets were \$2 to \$3 100. There is a good demand for violets all the time, though they do not get very high prices, but at New Years so many were rushed in at once that they declined greatly in price, and the market was glutted.

Carnations were \$2, \$3 and \$4 a 100, Grace Wilder bringing the highest price. In a good many cases the carnations have greatly disappointed the growers. Mignonette was good, ranging from \$4 to \$8 a 100, Smilax 15 to 20 cents; asparagus 20 to 35 cents.

Certainly, stuff sold better than was expected, taken throughout the prices averaged a little higher than last year, but this was the result of the small crop. The flowers would have been fine had there been sunlight, but continued rain and fog took away the color, especially in Mermets, Beauties, Wattevilles and other pink roses.

The trade in Christmas greens was not

larger than last year; in some directions there was a falling off. Imported holly and mistletoe sold well; there is an increased demand for the latter. A good deal of the American mistletoe has been marketed and has been sold to the dealers simply because of its cheapness. It sells for \$10 a case when the English variety sells for \$25. The trouble is that this is apt to injure the sale of the finer sort, for many people in this country are unfamiliar with the plant, and when they see the southern variety, with its shrivelled leaves and scanty yellowish berries, they receive a poor impression of mistletoe in general, and are less likely to buy it again. There is likely to be a larger importation next season; it can be shipped very cheaply from the apple districts abroad, and if the price is reduced here the sales are likely to be larger. It seems to have traveled very well this season; last winter a great deal of it lost all the berries in transit. The southern holly was really good, but it lacks the substance of the imported variety, nor is it so well berried.

Just after Christmas the gripe began to show that it would not be ignored, and there is no doubt that this plague had a good deal to do with the dull trade of New Years. Half the florists were down with it, and presumably half their patrons. Prices of flowers took a terrible drop; many were just about one half what they were at Christmas. The day before New Years many dealers declared they were not doing so much as an ordinary day, but there was a slight revival on New Years day, and though it was certainly dull the florists did better than they expected. Prices were certainly small. The experience of two or three years past shows that Christmas brings a much greater volume of trade than New Years; at the latter time there is very little increase over an ordinary good day.

The retailers still say that a box of choice flowers, especially fine roses, is the favorite holiday gift; baskets are much less called for, and designs have gone out of date. The demand for loose flowers makes a fine quality necessary; there is no use for poor flowers.

EMILY LOUISE TAPLIN.

Boston.

The holiday trade was in the main satisfactory. When we consider what it might have been there is especial cause for congratulation. Plants were in such condition from the long continued warm weather that had a sudden spell of cold and stormy weather been experienced just before Christmas, there would have been almost nothing to sell. As it was about everything was well cleaned up.

The worst "black eye" was sustained by some of the violet growers who had

miscalculated the available crop and the temper of the dealers and came to their senses only when it was too late.

A noticeable feature of the cut flower demand was the call for colored flowers. There were no where near enough red roses or colored carnations. White carnations were also very scarce and hly of the valley, camellias, hyacinths, etc. sold well. But Harrisii lilies and callas moved slowly. Freesias also were difficult to dispose of at any price.

Towards New Year's the lilies sold better and the demand for carnations of all colors continued unabated, but roses eased off somewhat in price. Double pink bonvardia sold well, also magnolietta and Primula obconica.

The great bulk of the holiday trade in the best stores is now in loose cut flowers.

The sale of holly, mistletoe, palm leaves and needle pines shows a large increase over previous years. Southern mistletoe was received generally in splendid condition, but holly was not as well colored as it was last year. W. J. S.

CHICAGO.—Nearly all the florists report a larger Christmas trade than ever before, some a much larger increase than others. Fine roses and violets led in demand, while fancy long stemmed carnations show a further advance in popular favor. Grace Wilders sold readily at \$1.25 to \$1.50 a dozen. Prices obtained by the retailer ranged about the same as last year, those paid were also about the same as last year, possibly a trifle higher on fine quality carnations. Supply was good and equal to demand at prices asked, in fact there was rather a surplus at the last moment, owing to held back stock being unloaded at that time. Quality averaged about equal to last year—a little off on some stock and better on others, averaging up about equal. Trade in Christmas greens was larger, holly leading, and Georgia needle pines coming more into favor. New Year's trade amounted to but little. The trade all through the month of December was the best ever done in that month by many of the florists, but this was due largely to the season of opera which preceded the holidays.

BALTIMORE.—About 25 per cent larger than last year. Less call for P. W. narcissus and tulips. Prices obtained were about same as in former years; prices paid were a trifle higher. Supply equal to demand at prices asked, quality better than last year. Plants for decorations sold well. Our market house did most of the Christmas green trade, the store florists having but little.

RICHMOND, VA.—Much larger than last year, violets and roses leading in demand. Prices obtained were about the same as last year. With the exception of violets and roses the supply was equal to demand at prices asked. Quality somewhat below the standard on account of cloudy weather. Boxes of loose flowers in best demand, no baskets or bouquets called for.

TORONTO, ONT.—Very much smaller than last year, especially at New Year's. More demand for roses and loose flowers generally rather than bouquets. Prices obtained were about the same as last year, those paid were also about the same except for roses, which were a little higher. Supply was not equal to demand owing to so much dull weather, quality compared favorably with last year. Trade in Christmas greens was fully as good as last year, supply of green ran out. The day before Christmas being

rainy and unfit for shopping probably accounts for diminished trade.

COLUMBUS, O.—Much larger than last year with increased demand for roses and holly. Prices obtained and those paid were about equal to last year. With the exception of roses, on which there was a shortage, the supply was equal to demand. Did not dare to order roses from a distance for fear of getting salted stock—our former experience. Quality of what we had was better than ever before. Trade in Christmas greens was larger. Hitherto there has been little or no business for two weeks succeeding January 1, but my business has continued good up to to-day (Jan. 7), at times all I could attend to.

BROOKLYN, N. Y.—Somewhat larger than last year. Prices obtained for roses and carnations were higher and those paid were about \$5 per 100 higher for roses. Supply was equal to demand at prices asked, quality about same as last year. Trade in Christmas greens about 25 per cent larger than last year. The habit some growers have of holding back stock for higher prices and then unloading on to his customers a lot of stale flowers should be stopped.

PHILADELPHIA.—About 20 per cent larger than last year. One florist reports increased demand for orchids. Prices obtained and those paid for roses were slightly lower than last year. Supply was equal to demand at prices asked and quality was better than usual. With the exception of mistletoe trade in Christmas greens was not so large.

CINCINNATI.—Somewhat larger than last year with increased demand for roses. Owing to the scarcity of roses held out for good prices and got them. Prices paid were on roses a little higher than last year and on Romans and similar stuff a little lower. One florist reports that the supply was equal to demand at the prices asked, and another says supply was short. Quality of flowers about as usual. Regarding Christmas greens one florist says that churches used less and stores and restaurants more, and another reports that with the exception of holly and laurel the trade in greens was a failure.

GRAND RAPIDS.—About 10 per cent larger than last year with no marked increase in the demand for any particular flower. Prices were about same as last year. Good supply of flowers, but no surplus and quality good. Trade in Christmas greens was somewhat larger than last year. Trade in loose flowers and boxes of same was larger than last year while demand for baskets was less.

DAVENPORT, IA.—About 10 per cent larger than last year. Everything sold well except Roman hyacinths, which did not sell well until other stock was all gone. Prices obtained were slightly better than last year. Supply was not equal to demand, quality about same as last year. There was a good sale for holly, but not much for other greens.

ST. PAUL.—About the same as last year. There was a noticeable decrease of orders for fine roses and some florists got stuck on the better grade of roses on account of the price. Bons and Gontiers with Romans sold well. Prices obtained were about same as last year, possibly not quite as good. Prices paid were somewhat higher for good roses. Supply was fully equal to demand, some stock left over. Quality fully as good as last year, in some instances better. Holly sold well

and lycopodium was used a great deal more than in former years. Mistletoe did not sell well this year. New Year's trade was light. The business as a whole was cheaper all through the holidays.

ATCHISON, KAN.—Nearly one third larger than last year, prices a little lower, supply of flowers not equal to demand, quality of flowers compared favorably with last year.

UTICA, N. Y.—About 25 per cent increase over last year. Choice roses, carnations, orchids and other choice flowers were in demand in excess of supply. Better prices were obtained for choice flowers than last year, common stuff sold about the same as usual. Sale of Christmas greens was about as usual, much greater competition. Quality of roses and carnations was not quite equal to last year. An increased demand was noted for very choice flowers, such as anthuriums, eucharis and orchids.

ROCHESTER, N. Y.—But little difference from last year in any respect.

DETROIT.—From 25 to 50 per cent larger than last year, best Christmas we ever had. Demand for roses is still on the increase, and an increased demand was noted this season for tulips, valley and violets. Could not get enough American Beauty roses even at \$1 each. Prices obtained were about the same for the usual run of stock, but choice flowers brought better prices. Supply was equal to demand, quality did not average quite as good as last year. Competition in sale of Christmas greens was sharp. Holly sold well. Customers didn't seem to have much ready cash Christmas.

LOUISVILLE, KY.—About 25 per cent larger than last year, an increased demand for carnations, Mermets and red roses. Prices obtained were better on all kinds of flowers, prices paid were about the same as last year. Quality of roses was not as good this year. Sales of Christmas greens were about double those of last year, and the holly was better. We had an abundant supply of bulbous flowers.

ST. JOSEPH, MO.—Larger than last year, roses were most called for, but everything went. Prices obtained were rather better, especially for good roses. Supply was not equal to demand, quality not quite so good as last year. Trade in Christmas greens was about the same as last year. The long continued cloudy weather affected the rose crop, which was light.

NEW HAVEN, CONN.—About the same as last year; increased demand for cheap, showy flowers. Prices obtained were a trifle lower and prices paid higher than last year. Supply fully equal to demand at prices asked, quality generally better. Sales of Christmas greens were larger. Each year proves the fact that reasonable prices give the best satisfaction.

PROVIDENCE, R. I.—Holiday sales were about 25 per cent smaller than last year. Prices obtained were about the same, supply not equal to demand, quality not as good as last year.

NEW BEDFORD, MASS.—About one third larger than last year; increased demand for pinks, violets and potted plants, such as azaleas, ferns, palms, etc. Prices obtained were about the same as last year, prices paid were lower on all except roses. The supply was equal to demand except on roses; quality was better except with those shipped by commission men. A big demand for green wreaths and holly.

LOG FILLED WITH ORCHIDS, ROSES AND ADIANTUM FERNS.

Holly with berries was very scarce and sold for a good price.

INDIANAPOLIS, IND.—About 20-per cent larger than last year, the increased sales being mainly of cheaper flowers, such as bulbous bloom. Prices obtained were about the same as last year, but we had less kicking. Prices paid were higher. Supply was sufficient and quality much better. The competition in the sale of Christmas greens was very keen, and on account of warm weather it was unsatisfactory to handle it. Wouldn't it be a good idea to hang up in every store a printed statement of the reasons why prices are so high at the holidays. It would save a good deal of explaining to customers.

ALBANY, N. Y.—About one fourth larger than last year. Possibly an increased demand for violets. Prices obtained were about the same as last year, prices paid were somewhat higher for roses. The supply was not equal to demand, quality of flowers about the average. Trade in Christmas greens was larger than last year. The dull weather caused many Perles to be malformed.

PORTLAND, ME.—Holiday trade about one third less than last year and prices lower. Possibly an increased call for roses and violets. Supply was not equal to demand, quality not as good as last year. Had no trade in Christmas greens this year; 10 years ago our retail trade the day before Christmas ran from \$250 to \$300.

NEW ORLEANS.—Holiday sales were 50 per cent larger than last year. Roses lead any other flower in demand. Had plenty of bulbous flowers from home grown stock. The large demand and consequent good prices obtained may be attributed to some extent to the large number of strangers in the city. There was a good supply of flowers of excellent

quality owing to the favorable weather. Holly and mistletoe is the only green in demand here at Christmas. The weather is quite spring-like.

DES MOINES, IA.—Holiday trade was about one third larger than last year. There was a larger call for Roman hyacinths, narcissus and carnations. Roses were too high priced at Christmas to sell well here; \$3 a dozen stops sales with us; there was a better demand for them New Years. Prices received were about same as last year, prices paid were higher for Christmas and lower for New Years. Roses were not equal in quality to last year. With the exception of holly and mistletoe the call for Christmas greens was lighter. We could sell many more roses at the holidays if we could buy them so that we could sell at from \$2 to \$2.50 a dozen; \$3 a dozen for Perles scares people here.

ROCKFORD, ILL.—About 50 per cent larger than last year with increased demand for roses. Prices obtained were somewhat lower than last year, those paid were about the same. Supply was not equal to demand, quality about same as last year. Increased trade in Christmas greens.

ERIE, PA.—About 25 per cent larger than last year with increased demand for carnations, violets, bonvardia and hyacinths. Prices obtained and those paid were about the same as last year. Demand exceeded supply, quality better than last year. Sales of Christmas greens about as usual.

EVANSVILLE, IND.—About the same as last year with an increased demand for roses, Roman hyacinths and P. W. narcissus. Prices obtained were about same as last year for roses, higher for Romans, prices paid were about 10 per cent higher. Short on roses, plenty of other flowers, quality not equal to last year, especially

roses. Not so much call for wreathing, about the same as usual for holly. The unseasonable weather had much to do with the limited supply of roses, being cloudy and dark.

LOWELL, MASS.—Larger than last year with increased call for long stemmed pink carnations. Prices obtained and paid were about the same as last year, could have sold more colored flowers, quality about same as last year. Slight increase in sales of Christmas greens.

MONTREAL.—The Christmas flower trade this season has been fully up to the average, perhaps more profitable to the growers than usual, as less flowers were imported from the United States than on some former years. On account of the dark weather roses were rather scarce and not near up to the demand. Violets were very scarce, there being no home supply, but in carnations, Roman hyacinths, narcissus, tulips, lily of the valley, callas, Harrisii lilies and smilax, the supply was about up to the demand. One St. Catherine street florist made a great display in his large window of Chrysanthemum "Christmas Eve" in pots; in the same window were some fine Harrisii. The call for made up work was less than usual, the great bulk of the flowers were sold loose or made up in neat boxes, a custom which is much better for the florist, as he can handle a larger quantity in the same time than he could in the old style of bouquets and baskets. But it has the effect of calling for only first class long stemmed stuff. The sale of plants owing very much to the mild weather was very large. The quantity of Chinese primroses, Jerusalem cherries and cinerarias sold was unprecedented; there was also a call for small palms, dracaenas, etc. The New Years trade, though not up to Christmas, was good; on account of the scarcity of flowers prices were about the same.

There are some complaints about lily of the valley not forcing as quick as usual, some thinking the pips are not as ripe as usual.

WILMINGTON, DEL.—Somewhat larger than last year; prices obtained and paid about as usual at that season; supply equal to demand at prices asked, and quality about equal to last year.

HARTFORD, CONN.—About the same as last year; prices obtained and paid about as usual at that season; supply not quite equal to demand, quality about as usual.

KANSAS CITY.—Somewhat larger than last year, roses as usual led in demand, and there was a good call for Roman hyacinths. Prices obtained were about same as previous years, prices paid were higher on roses, but about the same on other flowers. Supply was about equal to demand at prices asked. Quality of flowers was equal to previous years. Sales of Christmas greens were very large, especially on holly. Competition in sale of wreathing of lycopodium was very sharp, the town being flooded by speculators who had plenty left on their hands. Business in general is increasing here.

CONCIL BLUFFS, IA.—About 25 per cent larger than last year with an increased call for pink roses. Prices obtained were a trifle higher than last year, quality equally as good and supply satisfactory. Our retail prices here are about 15 to 20 per cent lower than Chicago wholesale prices.

MILWAUKEE.—Somewhat larger than last year with increased demand for palms, ferns, violets and lily of the valley. Prices obtained and those paid were about same as last year, quality of flowers better; supply good. Sales of Christmas greens were larger, especially on holly. New Years' trade has fallen off greatly, Christmas trade increased. Bulbous flowers all good except Lilium Harrisii, which was not so productive as last season.

PITTSBURGH.—About 10 per cent larger than last year. Roses still lead, but all good flowers were in demand. Prices obtained were slightly lower and those paid were about the same as last year. Supply of flowers not equal to demand at prices asked and quality rather better than last year. Sales of Christmas greens were slightly larger than last year.

NASHVILLE, TENN.—A shade better than last year; prices obtained were lower and those paid were higher than last year. Supply equal to demand and quality about the same as last year. No increase in the sale of Christmas greens.

MEMPHIS, TENN.—About same as last year with increased call for roses and Roman hyacinths. Prices obtained were higher for roses, about the same as last year for other flowers. Supply was equal to demand at prices asked, quality of flowers good. Weather has been so warm that Romans, narcissus, violets, shrubs, etc. were in bloom outside at Christmas.

BUFFALO.—About 15 per cent increase over last year. Strongest demand was for medium priced roses, less call for common soft stuff. Prices obtained were about same as last year, the very high cost necessitating such a high selling price as to exclude many would-be buyers of certain kinds of flowers. Prices paid were about same as last year—way up, too high at Christmas with a disproportionate drop before New Years. On the average the supply was equal to demand

at prices asked. Quality of flowers was not up to standard. Trade in Christmas greens was rather slow, rainy weather on the 24th interfered somewhat. Could the matter of annually forcing prices up so high at Christmas only to drop again before New Years be obviated much good to the business would ensue. Buyers became discouraged and frightened off at Christmas and get the idea that flowers are beyond their purses all through the holidays.

OMAHA, NEB.—About one third larger than last year with greatest demand for fine roses. Prices obtained were a little higher than last year, and quality a little better. Trade in Christmas greens about the same as last year.

MINNEAPOLIS.—About the same as last year and sales were at about the same prices, though prices paid were higher. Supply was fully equal to demand at prices asked, quality of flowers not quite so good as last year. Sales of Christmas greens were larger than last year.

LEAVENWORTH, KAN.—Slight increase over last year with more demand for carnations. Prices obtained were about the same and prices paid were higher than last year. Demand exceeded supply; noticeable improvement in the quality of flowers. As good a demand as ever for Christmas greens. Wholesale prices of flowers were too high to enable us to profitably buy and sell in this market.

LAWRENCE, KAN.—Much larger than last year with greater demand for roses. Prices obtained were about the same as last year, supply not equal to demand, quality rather better. Trade in Christmas greens not quite as good as last year.

ST. LOUIS.—About 20 per cent larger than last year with increased demand for Beauties and red roses. Prices obtained and quality of flowers were about same as last year. Trade in Christmas greens was larger than ever. Warm weather made holly very poor.

LITTLE ROCK, ARK.—Smaller than last year. Good roses were in best demand. Prices obtained were considerably less than last year. Supply not quite equal to demand, quality better. No trade in Christmas greens. Mistletoe and holly can be gathered in the woods here and it could be bought on the streets from boys. The reason our sales of flowers were not as large as formerly was the exceedingly warm weather we had here for about three weeks before Christmas.

FORT SCOTT, KAN.—Holiday trade was good, 50 per cent greater than last year. Owing to bright weather the flowers were first class. Roses were especially fine and sold readily at a good price. The supply was about equal to the demand. The call was mostly for loose cut flowers.

Decoration at the Patriarch's Ball, New York.

The great hall at the Metropolitan Opera House on January 2, being the social event of the season, naturally called for striking effects in decoration, and while the arrangement was not absolutely novel it was certainly beautiful and effective. The Opera House is such an immense place that it absolutely swallows up a small decoration, and an unlimited amount of stuff was used to fill it.

The idea of the decoration was to turn the auditorium into a northern forest, the foyer and corridors into forest glades, and the stage into a tropic garden, and this idea was very artistically carried

out. Red drapery was first hung along the front of the tiers of boxes to take away the ordinary undecided color, and these boxes being unused were screened and filled so as to give the effect of a precipitous mountain side. The foyer and corridors had walls and ceilings covered with green, holly, southern pine, juniper and trailing vines of ivy and southern smilax, as well as greenhouse smilax and asparagus, a good deal of the latter being used throughout the house. Palms and orange trees stood about in the foyer, and the elaborate tracery of the iron gates at the entries into the house was also hidden by green.

The idea of a forest was carried throughout the corridors, at every angle stood a cypress, and the folding doors opening into the auditorium were screened with ivy.

The front of the first tier of boxes was hidden by evergreen trees and occasionally palms; hung in the trees were masses of tulips, daffodils, hyacinths and here and there an orchid. The interior of the first tier was filled with a bank of evergreens, with a mass of flowers in front; flats of daffodils, tulips and hyacinths, the green of the interior sloping up like a bank. The next tier was similarly filled, but without the flowers, and this arrangement was carried on up to the dome, which was screened by a light arrangement of green. The proscenium arch was also well covered, framing the stage, which was set with a garden scene. Seats were disposed beneath palms and orange trees, while around the back was a raised terrace of flowers, chiefly lilies and pink roses. In the supper room the only decorations were palms on the tables.

It will be noted that very few flowers were used throughout, the largest part of the arrangement consisting of Christmas greens, which have the double advantage of being cheap and effective. A good many palms were of course used. These commonplace materials were arranged with consummate art, and Mr. Klinder has every reason to be proud of his work, though it did not help the languid cut flower trade of January 1. However, it was the largest decoration of the winter, and the general assertion that the vast Opera House looked like a bower was fully borne out. E. L. T.

Adiantum Pubescens.

This useful fern is of the easiest culture, not at all delicate, is graceful and well adapted for use in fern plantations, baskets, etc. It is very largely grown for the purposes named, and those who may be as yet unacquainted with its value will find it a very desirable plant to have. It is a standard sort and small plants can be purchased at very reasonable rates.

Hail Notes.

If your holiday stuff sold for a good price, devote a little of the profits towards insuring your glass against hail. The "hail belt" may come your way before the year is over and you will feel much better if you are insured. Delay is dangerous, as several Philadelphia florists learned last fall at heavy cost. In order to illustrate how much a little delay sometimes costs, we give an incident which occurred in Philadelphia. A prominent florist took out his check book one afternoon for the purpose of sending in an application for hail insurance. A customer at that moment came in for a bouquet; afterwards other matters claimed the florist's attention, and the matter was neglected. Last October he lost

ADIANTUM PUBESCENS.

3000 square feet of glass by hail, and no insurance. It is needless to add he is now a member of the Florists Hall Association. He doesn't intend to get caught again.

JOHN G. ESLER.

Long Island Notes.

BY WM. FALCONER.

A CUT-LEAVED CINNAMON FERN.—Mr. A. Gilchrist of West Toronto Junction, Ont., sends me specimens of *Osmunda cinnamomea* with distinctly incised pinnæ. One of his recent discoveries among wild plants.

RUPELLIA MACRANTHA.—Mr. A. Lindstrom of Richmond Hill, N. Y., says "it is a thriving plant and a good bloomer." Yes, I grow lots of it for mid-winter flowers, and find it very useful for filling up the basket as well as decorating the conservatory.

CHRISTMAS ROSES.—Out in a cold frame covered over at night with mats and shutters I have a lot of *Helicoborus niger maximus* in fine bloom. They are large showy flowers, coarse-appearing to some maybe, but at this time of year it is very handy to be able to cut an abundance of big white blossoms that require no heat in winter nor particular care at any time beyond a little shade in summer and the shelter of a frame in winter to enable us to get fine flowers.

CARRYING A STOCK OF HARDY PLANTS.—"Yes, I am going into hardy perennials,"

said a local florist to me the other day, "but to begin with I will not carry a big lot of them. I will just make a selection of the very finest and most showy sorts and keep good clumps of these and sell by sample; I can make arrangements with large growers to get from them any quantity as I need them."

WILD FERNS.—Some weeks ago I sent the wagon out into the woods around here and brought in quantities of *Aspidium acrostichoides*, plants carrying fine bunches of perfect fronds, and packed the plants close together but quite orderly in deep cold frames which I can get at easily any time during winter. I like the sterile better than the fertile fronds. By getting them in October or early in November we get them while they are in perfect form; if we delay till December they are apt to be a good deal broken. Very nice things to cut from in winter and a saving on greenhouse fern fronds.

THE NEMBRO CHESTNUT.—Your note, page 212, reminds me that our specimen bloomed the summer after it was planted, and when only three years old, and it has bloomed twice a year ever since. This early flowering and fruiting and perfecting two crops of flowers, and setting (but not ripening the second one) two crops of fruit a year has been an annual feature of our plant. We got it from Andrew S. Fuller.

Yes, the JAPANESE CHESTNUT is the early fruiting one. But sometimes it is

and sometimes it isn't. We have a handsome specimen now eight years old and it hasn't blossomed yet! True, at Westbury, Creedmoor and other neighboring places they fruit at three or four years old. But even there, some do and some don't.

CYPRIPEDIUM SPECTABILE is getting scarce as a wild plant. A friend in the cypripedium district writes me: "I had an order for one thousand plants from an English firm, and during the summer I went to find out a good place for them and found a swamp of some thousands of acres with plenty of them in it. But when I went there this fall to dig them the place had been run over by fire which destroyed all vegetation. I then wrote to some friends to assist me in getting the plants, but I have succeeded in getting only two hundred. In fact the cypripediums are getting scarce. And I am thinking about getting a piece of land suitable for them and growing them in it. * * * I believe before many years it will be almost impossible to get any wild plants."

FLOWERS IN SPAIN.—A gentleman recently returned from a trip through Spain speaks warmly of the beauty and sweetness of the different kinds of narcissus growing wild about Gibraltar. And among the most striking plants now in bloom in the gardens he mentions the gorgeous poinsettias. And he brought me home specimens of *Salvia involucrata* var. *Deschampsiana*, *Euchsia corymbiflora*, *Viburnum tinus*, *Bignonia venusta* and *Arbutus unedo* (in fruit). An evergreen in one of the gardens and which pleased him immensely proves to be a Japanese *cephalotaxus*. In the gardens generally he did not find a great variety of plants or anything especially new or uncommon. Crossing to Morocco the most striking plant he saw there was the "branching palm" *Dracena Draco*.

IMPATIENS HAWKERI.—A beautiful flower. The individual blossoms are large and brilliant but not nearly so abundant as are those of *I. Sultanii*, which also is leafier and stockier, and, withal, I think, the better plant.

POINSETTIAS.—There is no doubt of it, we get larger and finer heads as a rule from poinsettias planted out on benches than from those grown on in pots, and they need less care to bring them to perfection.

STEVIA.—The dwarf variety now is mostly grown. Ladies love to cut big bunches of it to use alone in vases. Its full body without stiffness, the fragrant flowers and abundant green, give it a charming effect.

TUBEROUS BEGONIAS.—A friend who makes a specialty of tuberous begonias writes me: "Those that bloomed latest were the best. I have doubles as large as roses and some singles that will easily measure six inches across, good round flowers."

CANNA.—If you have any of the finer dwarf gladiolus-flowered varieties, put a few of them and grow them along and up to the light as you would callas, and note their behavior. Even *Canna Ehemanni* for as big a grower as it is if grown in pots and somewhat curbed for room, keeps within bounds and blooms beautifully.

MUSA ENSETTE FROM SEED.—A neighbor took my advice to buy a hundred seed and sow them at once; this he did about a month ago and now he has got over sixty little plants up and more coming. He sowed in a flat in a warm greenhouse. The seedlings are coming up irregularly.

a few every night. These little seedlings will make splendid plants for spring sales; then if they are planted out in rich, moist, sunny, sheltered land, no tropical plant will grow more luxuriantly or have a more imposing appearance.

BLUE GUM TREES FROM SEED.—Get an ounce of fresh seed of *Eucalyptus globulus*, sow it now and raise thousands of plants. By March they will be pretty little plants in 2½ or 3-inch pots and in good shipping order; but if you wish to grow them on you can have 3 or 4 feet high plants in 8-inch pots by next May. But if this be not desirable you can keep them in good healthy condition in 3 or 4-inch pots till planting out time in May. They grow most as rank as corn the first year. *Globulus* is the commonest and most desirable of any, and a very handsome glaucous, blue-leaved plant for sub-tropical effect in summer gardens.

FEVER TREE is another name for it. Australian fever tree, or Californian fever tree, and many people entertain the notion that the presence of this tree is a sure antidote against malaria, but this isn't so. And every now and again, some poor misguided crank having "discovered" this eucalyptus antidote, yells abroad with philanthropic valor—"plant eucalyptus trees in New Jersey and Long Island, dry up the swamps and rid the country of malaria!" Fiddlesticks! The *Eucalyptus globulus* is not hardy in the north, and I doubt if any other species is either. But, I must allow, we haven't given *E. umigera*, the hardest of them, a trial yet, at least so far as I know.

LATE CHRYSANTHEMUMS.—On the first of last August I put in a lot of chrysanthemum cuttings, choosing fine, fat, succulent points. All struck but not as readily as they would have done in spring. When rooted I potted them off into 3s and later shifted into 4s, and plunged them out of doors in an open bed in the frame ground and left them there till the 15th of November, long after all other potted plants had been housed. They grew from 8 to 15 inches high and many of them had 2 to 5 branches, and they all budded—for to begin with they were only flower tips—and I disbudded them to from 1 to 5 buds each. The late propagation rendered them late in blooming and I left them outdoors just as late as I possibly could with safety in order to keep them still later. Had I shifted them into 5s they would have done still better. But as it was they were a great success, they kept their foliage till the last and every blossom opened beautifully, and I still have (December 17) lots of them in good bloom, but all of my big plants are past. Christmas Eve, Ethel, *Graudiflorum*, Buttercup and Mrs. Langtry and my seedling "3—86" were the cream of them. This seedling is white, and the best of the lot because it is a capital rooster, branches freely, carries many flowers and has fine foliage, at the same time its individual flowers are nothing like as good as Mrs. Langtry, hence it isn't worth a name or being "sent out." I merely mention this to show you how important it is for you to raise some seedlings yourselves every year and choose a few of those you find best for your own use.

And besides their use for late flowers for cutting, these little plants having no heavy bodies or embossed pots looked real pretty stuck in among the cattleys and other greenhouse plants to make a show. And for window plants nothing could be prettier; in fact many of them were sent away for this end. Then how much handier it is to keep over a lot of

these 4-inch pots for spring stock than to save the 8 and 10-inch pot plants.

In most every town and village December is a month of church fairs and at every fair there is a flower stand. Now it occurred to me that little plants such as these—thoroughly well rooted, in full bloom and with fine foliage and as tough and hardy as possible ought to sell at the church fairs.

New Varieties of 1888-9.

The varieties sent out have proved to be on the whole of more than ordinary merit. Taking those of American origin we must mention as being really valuable acquisitions: L. Canning, Mrs. E. W. Clarke, Mrs. Irving Clarke, Mrs. M. J. Thomas, Mrs. A. Blanc, Mrs. A. C. Burpee, Mary Wheeler, Excellent, Violet Rose, Advance, Mrs. I. C. Price, Coronet, Mrs. W. Barr, Llewelyn, Zillah, Miss Esmeralda, Mrs. W. K. Harris, Mrs. A. Carnegie, Mrs. DeWitt Smith, Harvest Queen, Mrs. Judge Benedict.

Of the varieties imported from Japan and distributed here, the collection of 1889 has given us some real gems in the lovely Mrs. A. Hardy, Kioto, Lillian B. Bird, Nessima, Mrs. Fottler, H. Lincoln and Empress of Japan.

Of the Japanese importations sent from England: H. Cannell, C. Orchard and Ed. Molyneux. Other new varieties from England and France, are Avalanche, Mrs. W. Coleman, Mrs. F. Jamison, Sunflower, Lady Dorothy, Miss M. A. Haggas, Miss Violet Tomlin, Mignon, Mons. Bernard, La Tosca, Mme. Ed. Key, Wm. Holborn, Mme. L. Leroy, J. M. Pigmy, Mme. Baco, M. Carnar, Sony. Exposition de Marseilles, Cythere, M. Brunet, Veil d'Or, M. Ed. Andre, Comte de Mun, Mlle. Camille Richards, M. E. A. Carriere, Superbiflora.

Of the seedlings shown for first time this year I can speak highly of the following, and have no doubt there are other good ones which I have not had the pleasure of seeing: Ada Spaulding, Grove P. Rawson, E. G. Hill, Harry E. Widener, John Lane, Shasta, Bohemia, Cyclone, Mrs. T. A. Edison, Zenobia, Mollie Bawn, Mistletoe, Emily Dorner, Emily Riemann, Ramona, Mrs. John Enlen, Mr. Frank Thomson, Eldorado, Mr. W. H. Trotter, Crown Prince, Lady Selkirk, Mrs. Lucy.

Of newly imported Japanese varieties, Louis Boehmer, a pink or lilac rose "Mrs. A. Hardy," will be a fine addition to the ostrich plume class. JOHN THORPE.

Late Flowering Chrysanthemums.

With me and my observations the following chrysanthemums have proved the best this year for flowering about Christmas time:

Edna Craig, a lovely white, and Snow-fairy, a fairy clean white; both are fine pot plants and beautiful cut flowers all through December. Lady Lawrence, Mrs. Beal and Rob. Bottomly (two near alike for separate names), the best large white flower for Christmas time. Snowball, as good as ever, came in about November 15 and kept good a month, but does not like to be made a later flow-

ering, gets red in late flowering plants. Mrs. Frank Thompson is good every time and in every way from November 10 up to January 15, and the later, the whiter it is, until at last it is a clean white.

Chrysanthemums intended for late flowering should be separated from and kept growing later than the October and November flowering. They are the most profitable of all. JOHN LANE.

Chicago.

Correction.

Errors have crept into the notes on "New chrysanthemums for 1890 which originated in Philadelphia."

Please correct as follows:

Gipsy (instead of Eclipse), bright mahogany red in color, very effective, good grower, incurved flower.

Miss Mimie Wanamaker (instead of Comet), very full flower, yellow center, outer petal florets white and drooping, very large. E. L.

Pteris Serrulata.

This is another fern which should be grown by every florist, as it is easily grown and very useful in filling plateaus and for similar work. It is an old sort, but there are probably many who do not appreciate its value to the general florist. It can be obtained at a moderate price from any grower of ferns. The crested form is also very useful.

"Landscape."

"Anglo Saxon, landscape. Seipe is the same as ship in friendship and means the state or condition of being." "A landscape means a piece of the earth's surface, and it is always understood that this piece will have a certain artistic unity, or suggestion of unity, in itself."

PHILLIP GILBERT HAMMERTON, Landscape Painter.

"Our art, to appear to advantage, requires some extent of surface, its lines should lose themselves indefinitely, and unite agreeably and gradually with those of the surrounding country."

ANDREW JACKSON POWING, Landscape Gardener.

"The masses of light and shade, whether in a natural landscape or a picture, must be broad and unbroken or the eye will be distracted by the flutter of the scene."

THOMAS WHATELEY, (*Observations on Modern Gardening.*)

"The principles of landscape gardening we conclude to be derived from nature or developed by the principles of landscape painting."

JOHN CLAUDIUS LONDON, (*Encyclopedia of Gardening.*)

ED. AM. FLORIST.—Can debate be profitable between friends who are agreed upon no premises; who take for granted what is not granted, and who use terms vital to the discussion, one in a different sense from the other? If not, a common understanding among all who are called gardeners as to how the following questions should be answered is much to be desired. Whatever will tend to bring us nearer to it is much to be desired.

1. With what significance, under sound usage, is the word landscape to be prefixed to the word gardening? If "landscape gardening" means anything distinctive from "ornamental gardening," for instance, what is the essence of the distinction? What is the use, what the purpose, of landscape gardening in distinction from other gardening?

2. Can that which is discriminatingly called landscape gardening, and that

PTERIS SERRULATA.

which is discriminatingly called ornamental gardening be fused together so that a given work may be regarded as a perfect combination of both? Is there, or is there not, a liability in attempting such a combination that the purpose of one will antagonize the purpose of the other and the result be confusion rather than fusion—disunity rather than unity?

3. Have in mind a body of land, like the site of Fairmount Park, which is more than four square miles in area, of beautiful but highly diversified topography, with deep valleys and lofty hills, partly wooded, partly open, here divided by a broad quiet pond-like river, here by a brawling trout stream, its banks sometimes bold, craggy and sterile, sometimes flat, fertile and grassy. Suppose that from points within such a body of land, views are to be had miles away toward sunset, ending in wooded heights faintly blue in the distance. If landscape gardening, so called, has distinctive purpose, would it be more or would it be less becomingly applied to such a body of land than to a small body of simple topography, the site of the garden before the cathedral in New Orleans, for example, the Bowling Green in New York or the Public Garden in Boston? And how is it with ornamental gardening?

4. Why should some pleasure grounds be described as parks and others as gardens? Does the term "park-like" mean anything that the term "garden-like" does not? If there is any distinction, what are the leading qualities of a garden other than those of a park?

The irreconcilable answers to such questions that must underlie the habits of

mind of different men, equally intelligent, well informed and interested in the subject, may be inferred from two or three examples of the manner in which such men manifest their ordinary attitude toward it.

In October you printed a paper that had been read before the convention at Buffalo by Mr. McMillan, the gardener of a large rural park outside of that city. It assumed to present certain views of what was considered by the author to be properly called *landscape gardening* and the key to what he thought the significance of the term was probably expressed when he said that the "lay of the land" is the groundwork of *landscape gardening*, these words meaning, I suppose, much the same as the words of my texts. The gist of the paper seems to be given when it says that in dealing with "any grounds of sufficient extent to have a distinctive *landscape* character, the general aim (of *landscape gardening*) will be to make a harmonious combination with the dominant characteristics which nature has already stamped upon the site. He (the *landscape gardener*) will seek a fuller or a richer development of the essential leading features, simply softening what is hard, clothing what is bare, filling out what is meager and enriching what is beautiful, all in harmony with the original type." These sentences sufficiently suggest how the author would answer the questions that I have submitted.

Afterwards (December 1, page 184 and 186) you printed a review of the McMillan paper from the accomplished pen of "Observer," who, while expressing warm

personal regard and friendship for Mr. McMillan, undertakes to show that his views are "in many respects totally erroneous." In combating them he refers to the slight degree in which he found himself interested in what he properly assumes to be a better exposition of Mr. McMillan's view than could be given in words, namely, his park.

This park has two principle features, one is a slightly undulating plain of turf bordered by masses of wood, mainly natural, but here and there pieced out and connected by new plantings and interspersed with a few scattered trees standing singly and in groups with glades between them. Sheep and cows run at large in it, and looking across it in almost any direction the distance is so great that forms and colors blend together, and all detail on the opposite side is obscure. Its "masses of light and shade are broad and unbroken;" its lines "lose themselves indefinitely and unite themselves agreeably and naturally with those of the adjoining country." No object calls for special admiration by itself. Nothing is obtrusive. There are roads and walks and a single group of low buildings, but they are kept so much behind trees and under their shadow that in a general view they are little seen. There is nothing, indeed, to be seen from many points but a broad, far-reaching stretch of partially wooded, slightly rolling pasture land. The other principle feature is a pond of forty or fifty acres with sylvan shores. This has been made simply by scooping the mire out of a swamp and filling the hole with water, so that the shores, except for a little additional planting, are pretty much what nature made them.

This is what Mr. McMillan may be assumed to mean when he speaks of finding the groundwork of landscape gardening in "the lay of the land." Observer speaks of it as *acres of dreary monotony*. He thinks if what he saw is to be called gardening that it compares with the gardening with which he is familiar as "the rude figures and crude paintings that mark the dawn of art" rank by the side of "the Venus de Medici or the Transfiguration of Raphael." He notices that scarcely any use has been made in Mr. McMillan's park of the immensely varied resources of splendor in color that modern scientific and commercial enterprise has recently provided. He saw no rarities, no *nouveautés*. Even the shrubs and perennials were as old fashioned as a last year's bonnet. His conclusion is that in what Mr. McMillan advocates under the name of landscape he is trying to lead a "retrograde movement," a return to the gardening of a primitive stage of civilization.

What do you suppose Mr. McMillan thinks of these comments? May he not be imagined saying to himself: "My friend does not appear to have understood what I meant by landscape, and he is judging operations for the improvement of the natural scenery of a body of land, within which one can have views more than a mile in length, by standards which might be applied, if not to a conservatory opening out of a drawing room, to an urban garden a stone's throw across, formed on made land and surrounded by tall buildings."

Take another case. In your issue No. 103, page 163, another gentleman, reviewing the same McMillan essay, describes a similar experience. There was nothing in the Buffalo Park, he says, that was worth to him the five cents which it cost him to see it, but he recognizes, as "Observer" can not, that it is possible to

apply to such a work another standard than that which he is habituated to use. He does not question that "from a landscaper's point of view" it may have some interest. What do these words imply? How does a "landscaper's" point of view differ from another man's—say a florist's? There is an article in a recent number of your esteemed contemporary, *Garden and Forest*, that may throw some light on the point—the landscaper's point. The writer of it is describing the recent "improvement" of a park in Paris, which, for one of its limited area, formerly had, he says, a certain degree of landscape beauty. Of late it has been attempted to combine with this beauty a share of ornamental beauty. The manner of the attempt is explained as follows: "Trees are encircled by flower beds, and even isolated exotic plants which are placed near them—as if they were not obtrusive enough in themselves—are surrounded in the same way. A tuft of pampas grass, which would be far better away, is rendered doubly bad by its ring of geraniums, or a wide-leaved palm overshadows a circle of crimson coleus." The result is apparently thought to be that landscape unity is destroyed by the ornaments, while the ornaments are displayed at great disadvantage because of the presence of objects and conditions which, left without ornaments, were adapted to give the place a distinctive landscape charm.

Would the following be a much exaggerated statement of the difference between the point of view thus exemplified, and that apparently occupied by those who are of Observer's way of thinking? Observer regards gardening as an "art," in the sense that painting is an art and sculpture another art, each having distinctive aims, each having distinctive principles. It would be better to say that there are really two arts, each having distinctive aims and principles, to both of which the name gardening is applied and is apt to be confusingly applied. To distinguish one from the other the prefixes *landscape* and *ornamental* or decorative, are sometimes used. How do they differ? If a man blind and deaf from birth were to ask how the art of music and the art of painting differ, a part of the answer would be that they respectively appeal to different emotional sensibilities. So, to explain how the two arts differ that are called by the name of gardening, it may be said that works of landscape art are addressed to one class of human sensibilities, works of ornamental gardening to another. Just this is pre-supposed when one says that a certain passage of landscape may be pleasing to those who are sensitive to landscape, but that he himself is not so, and to him it seems only dull and monotonous.

But not used to think of landscape gardening and ornamental gardening as different arts, may ask, if they are so, how they happen to have a name in common? A full answer would include the result of some historical inquiry, but, for the occasion, it may be sufficient to say that, regarded from the physical and superficial rather than the metaphysical, spiritual and essential point of view, which latter is the point of view of art, (that is to say of poetic design, motive or purpose to affect the imagination), they are not to be clearly separated, both having largely to do with the same class of materials and both largely employing the same class of mechanical appliances and handicraft processes in dealing with those materials. The common name witnesses this fact, as smith in coppersmith and in silversmith

testifies of men of different trades both working in metals, with common appliances and common methods.

There were, a year ago or more, as I remember, two short articles in the *AMERICAN FLORIST* from which it might be inferred that you, Mr. Editor, were rather inclined to take some such view as has thus been suggested of the difference between landscape gardening and ornamental gardening. One was a discussion of certain observations upon landscape gardening, so called, that had appeared in the *Century Magazine*; the other a reply to a correspondent, presumably qualified for ornamental gardening, asking how he could best proceed to make himself a landscape gardener. In both you referred to landscape gardening much as you might, I think, if you regarded it as an essentially different art from that of ornamental gardening.

Before fully adopting such a view, I should be glad, as I am sure that many others would, to see a better presentation than I yet have of the reasons that prevent it from being more generally accepted.

AN ATTENTIVE READER.

The Carnation Twitter.

When last Thursday I received the letter of Mr. Hollis, of South Weymouth, Mass., and also the specimens of his afflicted *Garfield* carnations, I was at once reminded that four years ago, when I was endeavoring to establish myself in a new location, that I had some experience of a similar nature, which at the time appeared to be the results of an effort to grow some carnations in solid beds, or as Mr. Hollis expresses it in beds of earth setting on the ground level. That particular occasion was the only time that I ever thought it worth while to try and grow the *Garfield* variety, and that was the only one affected of all those that I was testing that season. But the summer previous (1885) when I was still occupying my old property in the heart of the city, and which was a very hot, dry summer, I one day in order to save watering had a lot of carnations mulched with some fresh stable manure, and very soon thereafter the bulk of the plants were affected in a manner similar to the specimens submitted by Mr. Hollis; it being July we at once drew out all the diseased shoots and destroyed them, since which time I have never noticed the smallest sign of the pest on my premises, except in the other case noted.

From the above experience I have always supposed that the disfigured and distorted carnation growth was caused by an insect, but having occasion to be in New York last Friday, and in order to gain all the information possible on this important subject, I submitted Mr. Hollis' letter and specimens to Mr. Peter Henderson, who unhesitatingly declared that the trouble is caused by an insect. Mr. Henderson calls it the Carnation Twitter and has been a very heavy sufferer from its ravages, and is thoroughly familiar with its *modus operandi*. The insects seem to deposit their eggs among the young terminal leaves of the carnation shoots, the leaves so affected soon adhere together, become distorted, and present

the appearance of having been tied in a knot.

The most efficient remedy that suggests itself to me at present is to remove the affected parts as soon as possible after being detected and burn them. To prevent the appearance of the disease hereafter I would say abstain entirely from the use of fresh or green manure in every shape and form, as I am pretty well satisfied that the use of such manure has more to do with the matter than anything else.

I have no recollection of ever having seen a scientific description of this carnation insect in any horticultural work, and would suggest to Mr. Hollis that he, for the benefit of the fraternity, entrust some of the perfect insects and send them to an entomological expert for identification, description, etc.; we may thereby learn sufficient of its cause and habits to enable us to successfully fight the enemy.

Paterson, N. J., Dec. 30, '89.

Carnation Tidal Wave.

This new variety has continued to produce good long-stemmed flowers in fair quantity ever since September, but has greatly improved in quality during the past month. The color is a deep, rich, bright rose, very fragrant; the petals are fringed, and the flowers being raised in the center each one forms a perfect rosette. The habit of plant is dwarf and compact, something in the way of *Portia*, and very free flowering. My carnations were gathered clean the day before Christmas, and again on Christmas day everything at all like a flower was gathered close, but on passing through this morning I noticed that I could easily gather a hundred or more nice flowers of this variety from the 200 plants in the house, and they were so fine, and the stems so clean and long, that I thought a better opportunity would never occur for the *FLORIST* to pass an opinion on its merits, so I gathered a bunch of twenty-five flowers for that purpose, and when I had them all tied up nicely I found it necessary to have a box made specially for their reception. I ordered the box to be made exactly eighteen inches long, and the bunch of flowers just snugly filled it from end to end, which I think is good and sufficient proof of its being a long stemmed variety. I cannot recall a carnation that is anything near the color of this one, that is likely to be so satisfactory in every particular, and have no doubt it will generally be considered a valuable acquisition.

H. E. CHITTY.

Paterson, N. J., Dec. 27, 1889.

[The flowers sent were most excellent and on unusually long stems as described. There is undoubtedly a bright future before this variety. It is well known and much appreciated in the Chicago market.—Ed.]

Best Six Carnations for Cut Flowers.

On page 230 of the *FLORIST* for January 1, just received, W. C. asks for the names of the best six cut flower carnations. He will doubtless find some difference of opinion in a matter of such wide application, but I venture to recommend the following:

No. 1. *Grace Wilder* is a rich pink of a peach blossom shade, deeply fringed and very fragrant, a good grower, may always be gathered with stems ranging from 10 to 20 inches in length, and is always salable.

No. 2. *Portia* is a brilliant scarlet and a very free flowerer, fringed and quite

fragrant, may be gathered with stems from 10 to 20 inches in length.

No. 3. May Queen is a bright rich cherry color and about midway in shade, between Grace Wilder and Portia, a fragrant, free and constant bloomer, good strong habit and may always be gathered with long stems.

No. 4. Anna Webb is a deep crimson, of good habit and free flowering, there are crimsons producing larger flowers, but not so free, I therefore recommend this one for a beginner.

APPEARANCE OF SHOOT AFFECTED BY CARNATION TWITTER.

No. 5. Buttercup is a bright rich yellow, edged and streaked with pink and carmine, a very free flowerer and bold rugged grower, the flowers can generally be gathered with stems from 10 to 20 inches in length.

No. 6. Hinz's White, this in reality is not a white, but may be regarded as a fancy variety of the first importance, its pink and creamy tints sell it very readily, especially as the flowers are mostly quite large and generally produced on long stems.

The above six varieties with ordinary good carnation treatment will flower from the first of October until the benches are needed for the new crop the following year; I would, however, advise a beginner to add to the above a good white, say Silver Spray, and also a few plants of some such variety as Mrs. Carnegie or Hinsdale, both being good free flowering and very desirable varieties, which would add tone to and help sell the others.

Patterson, N. J., Jan. 4, 1890.

Wintering Water Lilies.

Having received many letters asking information in regard to wintering water lilies, I thought that a few hints might not come amiss to many who have had little experience in their cultivation.

The hardy ones, such as *Nymphaea odorata*, and varieties, *N. alba* and *N. tuberosa*, if they were planted early enough in the season to get established in ponds or cisterns, will stand the winter where they have grown. The tenderer ones and those not sufficiently established, or which have been grown in sunken pots, tubs or baskets, may easily be removed to a warm cellar where free from frost. If the temperature rises to 50° so much the better, especially for the exotic sorts, which should have all the water poured off the tubs or pans in which they are, and the roots left in the soil they have grown in and which should be kept nearly dry, or just damp enough to prevent the

bulbs or rhizomes from shriveling. The fact is that such kinds as *Nymphaea Devonensis*, *N. dentata* and other strong growing sorts—as they do not ripen their tubers very well—suffer more by being covered with cold water little above freezing point than from any other cause. They should be kept out doors as long as safe from frost, to mature the crowns of the plants as much as possible, and then taken indoors where the conditions above indicated may be found.

Once, having a large quantity of *N. Devonensis*, I placed a couple of quarts of tubers in a glass box and set them under one of the shelves in the orchid house, where they remained for two winters and the intervening summer; the following spring they were planted and all grew except a few on the surface which had been most exposed to the air and had suffered from "dry rot." They keep longer than potatoes if stored in much the same manner.

The small growing kinds, such as *N. flava* and *N. pygmaea* keep best if the soil is kept wet, or scarcely covered with water, and they are allowed to remain in the greenhouse or where they can get some light and warmth as they are to some extent evergreen.

Malden, Mass.

BENJ. GREY.

Spider Lily.

[*Pancratium rotatum*.]

The lily mentioned by your Waco, Tex., correspondent in a recent issue of the *FLORIST* is *Pancratium rotatum*. In this locality it is also known by the name of Spider lily, on account of the long narrow stamens, resembling somewhat the legs of a spider. They are hardy here and require no protection whatever, and give a quantity of bloom during June and July. A good supply of water is required while growing and blooming. The sketch I forward is copied from one of *Vick's Magazine* of 1881. E. RATELLE.

New Orleans, La.

Several other correspondents have replied to Mr. Mayer's query, giving the name variously as *Pancratium rotatum* and *P. Caribbeum*, but it is hardly necessary to print them as so many similar ones have been already given.

Rose Houses.

What is the best pitch for the roof of a rose house when facing the sun?

Does it make any difference whether we have 2-inch or 1-inch planks in the bottom of rose benches? Does the 2-inch plank prevent any heat from getting to the roots that the 1-inch would not?

I should like to have Mr. J. N. Mayer's opinion upon these matters. READER.

Wootton and Beauty.

I must say that some of us who have planted the Wootton rose are sadly disappointed. It does not at all come up to our expectations. Its vigorous growth and fine foliage are the only points we claim for it. The quality of its bloom will never place it among good roses. There was a limited supply of American Beauties for Christmas, which fetched fair prices, but it is the opinion that it is not profitable almost at any price.

Montreal.

JAS. McKENNA.

Rose Salfaterre.

I have two large plants of this rose with 300 feet of growth on each. They run under the glass and on the sides of a house 115 feet long which has a partition

in the center. The first half of the house I keep at from 55 to 60° and cut hundreds of buds or clusters of buds two weeks before Christmas. Since Christmas I have cut from the other part of the house which is kept cooler and which comes in two or three weeks later. By this arrangement I have a big crop on them at Christmas when roses are scarce.

JOHN RALPH.

Saratoga Springs, N. Y.

Chicago Notes and Comments.

BY EDGAR SANDERS.

The magazines and newspapers nowadays have often long articles on the wonders of the flower trade. Nellie Ily's chaser around the world, a Miss Bisland, just before leaving, dropped one of these articles for the *Cosmopolitan* magazine in the December number entitled "The New York Flower Market." Of the great sums that "any retail" bouquet store takes in per day in New York, or the fabulous sums given as the price paid for flowers for certain great balls, or the 140 acre nursery with 25 of them in greenhouses in New Rochelle, Westchester county, we have nothing to say, and suppose they are all true, because the great chaser says so, and she lived around there and obtained the information direct and from headquarters. But when she says, even though it apparently comes from one of these great establishments, "that Lincoln Park, Chicago, had been shipped this autumn \$40,000 worth of

SPIDER LILY

[*Pancratium rotatum*.]

plants" from that same establishment, all we can say is, it's a whopper. Lincoln Park has spent no such sums this year for plants, nay, more, there has not been spent that sum for plants, outside of the hardy trees and shrubs, in the 20 years the park has been in existence. As she says, Chicago levies a special tax, but not alone for plant purposes, but for general maintenance of its parks, and the people pay it willingly, but there are lots of legitimate ways for its expenditure besides such a crazy one.

In the matter of glazing, without laps, set down Florist J. T. Anthony, of this city, as opposed to it. It might do in the country which, however, his gardener doubts, but for city purposes in the dust

and smoke it is a terrible failure. All the under part of the glass is covered with a deposit of dust that creeps through, making it very unsightly and covering the plants with dust, besides being bad for drops.

At Weinhoeber & Co.'s greenhouses at Park Ridge all the violets from which next year's stock is to be grown, are kept in cold frames out of doors. This is in accordance with nature, and we doubt not is far the best for violets or carnations. Don't force or excite those from which your stock is to be raised.

Correction.

In the last number of the AMERICAN FLORIST containing the obituary notice of John Henderson, you had a prefix to the notice which I sent you, which contained the erroneous statement that Mr. Henderson was the author of a standard work on grasses. The first part of the notice was run so close to my remarks that I have been credited with the whole article. It is very mortifying to me, as it places me in the position of being grossly ignorant of my late friend's career. The work on grasses alluded to was written by John Henderson, of Northport, L. I., who was in no way connected with the subject of the obituary notice. P. II.

Odontoglossum grande.

With the increasing demand for orchid flowers during the fall months the blooms of this noble odontoglossum will be appreciated by all who are called upon to furnish choice flowers during this season of scarcity. It sends up its spikes of grand yellow and brown flowers—usually from four to six on a spike—and sometimes two spikes to the bulb—from September to November, furnishing colors so desirable to arrange with the cattleyas, laelias, cypripediums, lycastes and other light colored sorts which may be had in bloom at this season.

Odontoglossum grande is easily cultivated, but requires more decided seasons of growth and rest than many of this genus, notably crispum, one of the best known sorts, which seems to enjoy growing all the year in a moderate temperature. Whereas grande has a long season of rest, during which time it should be kept on the side of dry, in a temperature not less than fifty degrees at night, and then makes its new growths, sending up its flower spikes when the pseudo-bulbs are half grown. During the growing season—the latter half of summer—it requires a good supply of water, but the material should not be allowed to get into a soggy condition. To prevent this, the pots should be nearly filled with crocks and topped round the plants with a little sphagnum, coarse moss or any rough material, such as fern roots, etc. The plant should be grown in a shaded position, as the leaves are sure to yellow if given as much sunlight as many orchids enjoy; besides less frequent waterings are needed to keep the material damp, thereby lessening the danger of rotting the buds at the base of the pseudo-bulbs during the resting period, which begins after the plants are done blooming and lasts about six months.

The flowers vary in color, although not so much as those of the cattleya—some being nearly all brown, while in others yellow predominates, so that there is much pleasant anticipation in watching the flowers open on a batch of these plants. BENJ. GREY.

Malden, Mass.

The Unseasonable Season.

The temperature outside at 6 o'clock this (January 6) morning is 48°, and it is more like late March than midwinter weather. As I have been transplanting trees all day, as I also was most all last week; the ground is as dry and mellow as we have it in April. Openness like this I have never before known. But I tremble for the result. The woodbuds of many trees and shrubs are unduly forward, indeed some spiraeas are bursting their leafbuds. Jasminum nudiflorum is in good bloom. Lonicera Standishii is in full flower and right alongside of it L. fragrantissima has a few open buds, and L. Heckrottii has not yet ceased to bloom. Japanese quince bushes display a few scarlet petals and the Japanese witch-hazel is starting to flower some ten or eleven weeks ahead of time. Rhododendron dauricum has a few open flowers, but this is not unusual. Andromeda floribunda is mostly in full bloom, ahead even of A. Japonica, and the base buds of the racemes of Berberis Japonica are open and yellow. The catkins of hazel bushes are almost ready to shed their pollen, and I find a few periwinkles on warm slopes. Lots of dandelions are in bloom in the grass. Both red and white varieties (the southern form) of moss pink have a sprinkling of open flowers, so too has the yellow rock cress (Erysimum ripense) and perennial candytuft (Iberis sempervirens only). Viola odorata in its single forms has been blooming a little all winter in sheltered places, but, apart from pansies, no other species of violet has essayed to open a bud, no matter how early blooming in spring they are naturally. W. F.

OBITUARY.

CHARLES ELLIS HITCHINGS, of the firm of Hitchings & Co., died of pneumonia on December 31, at his residence in New York City, aged 36. He leaves a widow and family.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not aimed under this head.

SITUATION WANTED—By a young man, where he can learn the florist trade. 1 year's experience; age 17. Address A. P. AKERS, Johnstown, Pa.

SITUATION WANTED—By a true and practical florist and gardener; married; no children. Private place preferred. Best of references. A. DUBER, 92 Union St., Union Hill, N. J.

SITUATION WANTED—By thoroughly experienced florist; is a first-class rose grower and propagator; will be at liberty February 1st. Good reference. Address J. F. FORBES, Kalamazoo, Mich.

SITUATION WANTED—As rose grower or propagator or manager in a commercial place. German; single, 20 years' experience in this country. Would like to go on half shares. Address P. GOEBEL, Hall & Madison Ave. Grand Rapids, Mich.

SITUATION WANTED—By a single man, experienced rose grower, and propagator of all the leading kinds of cut flowers; understand forcing bulbs; good planter, 12 years' experience; references. Address N. F. care American Florist, Chicago.

SITUATION WANTED—By landscape gardener; very capable to lay out the grounds and build the greenhouses. First-class rose grower. Any one wishing such a man, the highest satisfaction will be assured. Gentlemen's place preferred. Please address ESTELLE LITTLEMAN, 404 Second Street, St. Louis, Mo.

SITUATION WANTED—By gardener and planter, of practical and executive ability, long experience in the management of all inside and outside matters. References answering all points. Preference at or near New York. Address FLANNERY, 31 Pacific St., Brooklyn, N. Y.

WANTED—A specimen plant of *Cycas revoluta*. C. B. WHEELER & Co., Milwaukee, Wis.

WANTED—Landscape and vegetable gardener; strong, industrious, sober and sensible man. E. T. NOEL, Nashville, Tenn.

WANTED—An experienced commercial florist and gardener; a single man preferred. Best of references required. Address C. F. GIBBS, Florist, St. Johnsbury, Vt.

WANTED—A commercial florist; single man; must be sober and active, and experienced in roses, carnations, palms and bedding plants. Address JOHN RECK, Bridgeport, Conn.

WANTED—Practical young men accustomed to handle large quantities of general stock correctly and with lightning rapidity. Highest references indispensable. Address H. W. BUCKBEE, Rockford, Ill.

WANTED—Two active young men with some knowledge of greenhouse work; wages \$20 per month and board. Also one man to do office, filing mail and express orders—some experience required. Apply to C. YOUNG & SONS Co., 106 Olive Street, St. Louis, Mo.

WANTED—A first-class florist to take charge of two to three hundred and three houses in Chippewa Falls and two in Keweenaw. Close of 1900 and 26,000 population. To a good, sober man I will give good wages. Address B. F. MILLARD, Chippewa Falls, Wis.

WANTED—A partner; must have commercial and practical experience in propagation. First-class facilities and good trade, can be indefinitely increased. Must have some interest in tenacity reliability. 12,000 feet of glass, 2 acres ground, steam complete. Address CARNELL, care American Florist, Chicago.

FOR SALE—A \$5,000 business on easy terms. For particulars, address X. care American Florist.

FOR SALE—Small commercial florist business. Two houses with beds, etc., complete, in a fast growing Connecticut town. A first-class florist and market gardener. A. Z. care Am. Florist.

FOR SALE—A valuable property in a thriving town in Western New York, 200 feet of glass, well stocked, roses and carnations, good markets, excellent shipping facilities. Particulars and reasons for selling by addressing S. care American Florist.

FOR SALE—A well appointed wholesale florist establishment; 22,000 square ft. of ground, covered with glass, in a lively suburb of New York City. All cut flowers are sold on the premises to first-class retailers, and the demand exceeds the supply. Excellent reasons given for selling. Price, \$50,000, one-third cash, balance on bond and mortgage. For particulars, address THOS. W. WEATHERED'S SONS, 46 and 48 Marion Street, New York City.

FOR SALE—A florist establishment, wholesale and retail, between 50,000 and 60,000 square feet of glass. Well appointed buildings, heated by steam; stock, tools and trade. In a thriving New England city. Houses well stocked and in first-class condition. Superbly adequate for selling. Price, plenty of room to enlarge, and well adapted for a lucrative business. Price, \$2,500. For further particulars address A. L. H. P. Box 288 Providence, R. I.

FOR SALE—An established paying nursery and greenhouse business, one of the best in California, rich soil, fine climate, long easy lease subject to purchase. Close to San Francisco, numerous large houses, heated throughout, complete assortment of landscape, a splendid chance, will pay from the first day. Can be purchased with privilege of trial if desired. Any one in want of a fine established business, heated throughout, one of the best of reasons given for selling. Address for particulars EMORY E. SMITH, 321 Market St., San Francisco, Cal.

FOR SALE.

Several thousand Vicius elastica cuttings; also several very large Ficus trees, 12 to 15 feet high, with from 100 to 250 young ones.

JOHN MILLER, Box K, Glenview, Ill.

PIPE AND BOILERS FOR SALE.

Having introduced steam in our place, we are willing to sell, at a low price, 8,000 feet 4 inch Cast Iron Pipe, and the following Boilers: a large Meyers, 14 feet HITCHINGS. For more particulars Address THE FIFTH EXCHANGE, 614 Chestnut St., Philadelphia, Pa.

TO FLORISTS AND GARDENERS.

I am about to erect for rental on the choicest part of Ninth Avenue, N. Y., opposite Manhattan Square and the Museum of Natural History, a store and greenhouse, to be constructed entirely of iron and glass, and of elegant design.

It will be supplied with steam heat and electric lights, hot and cold water, and fitted with shelving, racks and counters.

This is in the best part of the West Side, and is surrounded by high grade dwellings and a wealthy population.

Plans, terms and full particulars can be had by applying to

C. K. BILL, 62 Liberty St., NEW YORK CITY. Or the "EVELYN," 101 West 5th Street.

THE GREAT RED ROSE.

TRY THE
 **WOOTTON** 
 BEFORE YOU CONDEMN IT.

In order to meet the frequent complaints that the Wootton is not a good red rose for Winter Bloom, we have reduced the price to

THE AMERICAN FLORIST CO., Chicago.

THE CUT FLOWER TRADE.—A review of the cut flower trade for the past ten or a dozen years can not fail to be instructive. When we note the quantity of bloom that is turned into the market to-day at the holiday season and compare it with that of even ten years ago we can not help a feeling of wonderment as to when the limit shall be reached. But quantity is really of lesser note than the very great improvement in quality. It is well to reflect upon these things, as they show the distance we have traveled in a direction in which it seemed so difficult to advance and proves the possibility of still further progress. The demand for roses of first quality is certainly still on the increase; orchids are gaining rapid headway, though in no way militating against the progress of the rose. A number of the flowers which were some years since a strong dependence are now but little grown, but the rose and the carnation have apparently only fairly begun their reign in the hearts of flower lovers. The improvement in the culture of the carnation has been quite as marked as in the case of the rose, and in fact the progress of the carnation has been even more rapid in the last few years. And since first quality, long stemmed flowers have been placed in the market in quantity this flower may be considered one of the strongest rivals of the rose in popular favor. The lesson taught by our experience is that quality is what we must strive for above all else. Experience has shown us that people will pay for a first class article, and experience has also shown that the difference in cost of producing a good flower and a poor one is slight—that the best flowers are the result of skillful treatment rather than the use of expensive houses or machinery and that brains and executive ability can make the growing of flowers a profitable business, while lack of these essentials can make it a most expensive experiment.

THE HOLIDAY TRADE.—In this issue appears our annual report of the holiday trade, which shows the usual gratifying rate of increase in nearly all sections. That flowers are becoming more and more a necessity to many people and that a refined taste which must be gratified by the skill of the florist is becoming more and more general is evident. We believe that not a little of this increased demand is due to the improved quality of the flowers now grown, owing to the more thorough methods of culture now so general, and that further increase in demand will be governed largely by further improvement in quality, which shall be due to still more general skill in culture. The FLORIST believes that it has been privileged to play no unimportant part in bringing about this most desirable result, that the practical informa-

tion which it has been enabled to present twice each month to the trade has done much toward the general advancement and is gratified accordingly.

HISTORICAL.—The florists of the past generation, those who were privileged to look back and recount reminiscences of the early days of the trade in America are passing away one by one and with them are lost many interesting facts of considerable historical value. The FLORIST believes that an effort should be made to record and preserve these facts for the benefit of the florists of the future and also that many such details will prove of great interest to many of the present generation, hence it invites subscribers to send in any historical notes in their possession, that the same may be placed upon record in these columns. Philadelphia, New York and Boston should be able to furnish a good supply of rich material, and other cities and towns could all add their mite toward a feature which would be at once of great interest and of historical value as well.

THE HARDY PLANT TRADE.—Believing that the florist trade should be prepared to reap the benefit of the increased interest in hardy plants, we have arranged for a series of articles upon desirable sorts from the pen of Mr. Wm. Falconer, which will soon appear in these columns. They will treat entirely of the kinds which florists can profitably handle as a department of their business and we believe will be of peculiar value to the trade at this time. We see the crest of a popular wave which will bring into more prominence many of these plants which have been long neglected, and shall aim to give all needed information in time to make proper preparation to meet it with profit to the trade and satisfaction to the public.

THE NIGHT MAN.—Messrs. Gooding & Leitch, Cleveland, O., write to endorse Mr. Falconer's views regarding the night man, and say that he can do all the work named providing you get the right man, but they have found this difficult. They envy Mr. Falconer his night man and would be rejoiced to secure the services of such a one. Here is another department of the trade. Are you a day workman or a night workman?

WE THANK our readers for the many kind wishes and compliments expressed in letters renewing subscriptions. As it would be quite impossible for us to acknowledge each of these by mail we take this way of saying that the same are greatly appreciated and will spur us to further effort to please.

THE NEW DIRECTORY.—We regret to say that owing to unavoidable delay the new directory will not be ready before the 20th inst. We expected to have it out certainly by the 10th, but found it impossible to do so. We feel that we can safely promise it by the 20th however.

Catalogues Received.

Henry Mette, Quedlinburg, Germany, seeds; Wm. Swayne, Kennett Square, Pa., carnations; F. Barteldes & Co., Lawrence, Kan., seeds; Jno. S. Calkins, Pomona, Cal., trees and plants; W. R. Schmirer, Avondale, Pa., carnations; J. M. Thornburn & Co., New York, trade list seeds; same, retail catalogues; United States Nurseries, Short Hills, N. J., tree ferns; D. Landreth & Sons, Philadelphia, seeds.

Tulip Growing in Illinois.

We have before us a fine bloom of the yellow *Chrysolora* tulip cut from a bulb grown in the State of Illinois. Some few years ago Florist Geo. Klehm, of Arlington Heights, a large grower of cut flowers for the Chicago market, began an attempt to grow himself tulip bulbs for forcing, and he has successfully demonstrated not only that equally as good bulbs may be grown here as in Holland, but that they may be profitably grown. He now has 125,000 bulbs which he is growing on for his own use. This number occupy less than 1½ acre of land, and he states that the expense for labor for the three years growing necessary to secure good sized bulbs has not exceeded \$75 per annum, making expense for labor in the production of 125,000 bulbs but \$225. As the land is valued at only \$130 per acre the interest and taxes are nominal. He is confident that the total expense of producing the 125,000 bulbs will not reach \$300, making the net cost to him about \$2.40 per 1000. And he has the bulbs when he wants them; he is not subject to any annoying delays in importing. This experience proves that there are certainly great possibilities in this direction, and it is not at all improbable that when the facts are more generally known a very large proportion of our forcing bulbs will be grown at home.

Boston Notes.

M. B. Bunker, florist, under the Tremont House, has made an assignment again.

Herman Grundel, one of the pioneer florists of Boston, died at his residence at Eggleston Square, aged 66 years, on Sunday January 5.

The annual meeting of the Mass. Hort. Society took place on Saturday, January 4, and President Spooner made an admirable address. The first meeting for discussion occurs January 11, when an essay on the growth and nutrition of plants will be delivered by Prof. G. H. Whitaker, of the N. H. Experiment Station.

At the January meeting of the Gardeners' and Florists' Club an instructive essay on the education of young gardeners was delivered by Prof. B. M. Watson, of the Bussey Institute. A very interesting discussion followed, on the much disputed comparative value of school training and practical experience. The death of three members of the club was announced, viz: Mr. Herman Grundel, of Boston, Mr. Jas. Croughan, of Lynn, and Mr. F. C. Fisher, of South Sudbury, and committees were appointed to draft suitable resolutions.

There is no lack of material for corner conversations now-a-days. With such a variety of topics as the coming convention of the National Society, the capture of a certain florist's pet consignor by a competitor, the descent upon the city of an eccentric contemporary from Cincinnati, the recent Bunker failure, Wm. Robinson's 16-pound boy, the "grippe", and a stolen budding knife, there is no immediate danger of "immonous desuetude" at the Club. W. J. S.

Mr. Henderson's Bequests.

By the will of John Henderson, who spent most of his life in Flushing, L. I., \$2,000 is bequeathed to St. George's Brotherhood, Flushing, for the erection of an Episcopal chapel at Bay Side; \$1,000 to St. George's Church, \$1,000 to the College Point Mission Chapel, \$1,000 to St. George's Sunday school, and \$10,000 to the Flushing Hospital.—*N. Y. Times*, Dec 30, '89.

Import Duties.

ED. AM. FLORIST.—Please state in an early issue on which of the following there is an "import duty," viz.: Bulbs, roots, corms, tubers. It appears this information can not be obtained from the treasury department, neither will that department state what plants would be placed under the above classification.

A. B.

[It would be more difficult for us to do this to a certainty than to forecast the weather, for every appraiser in the U. S., possibly 200, has a right to his individual opinion in this matter (and he generally uses that opinion without reference to any actual knowledge of the facts) as to whether he will call these plants or bulbs. As stated in our last issue, canna root was called a bulb in Chicago appraisement and this decision was sustained by the department. We are quite positive that nothing has been definitely fixed in this matter, except that hyacinths and tulips are bulbs, dutiable at 20 per cent., doubtless gladioli also, while lily of the valley pipes or clumps and spiraea are passed duty free as plants. In general we believe that at present in importing any rare or unusual stock in roots, corms, or tubers, the importer would be entirely dependent on the personal whim of his local appraiser, as to whether he should be obliged to pay 20 per cent. or could obtain them free of duty as plants.—Ed.]

THE WORLD MOVES. Mr. Gregory catalogues chrysanthemums and adds his portrait.

B. L. HOFFMEISTER succeeds Hoffmeister Bros. as florists and seedsmen at Fort Madison, Iowa.

MILWAUKEE.—John L. Feber will open a retail seed store at 434 Milwaukee street on February 1.

WM. H. MAULE is out with a 4c. catalogue and so are W. Atlee Burpee & Co. and John Lewis Childs.

A. C. NELLS & Co. are now located at 66 Cortlandt street, N. Y., and the A. C. Nells Co. at 64 same street.

THE A. B. CLEVELAND Co. have made an offer to their creditors of stock to the amount of their claim in the reorganized concern.

A RESUME of the grass seed trade at Chicago for 1889 shows that timothy seed sold lower than it has since 1887, and clover lower than ever before.

THE FOLLOWING appears in an Oregon paper: "The famous Hovey Seed Store, of Boston, and Hovey Nurseries, of Cambridge, Mass., have been moved to East Pasadena, California, where the business will be conducted as The Raymond Flower and Seed Store, C. H. Hovey, manager, East Pasadena, Cal."

MR. MAULE ("Man-ley" as the gardeners say) offers in his new catalogue the *Practical Farmer*, which he calls "The Great Dollar Agricultural Weekly." We join Mr. M.'s friends in the wish that his "Great Dollar" may always remain in the paper as in the title, coming back when wanted, and that the weekly part may never be spelled with an a.

Rubber Packing.

In answer to an inquiry in our last number regarding the use of rubber rings for jointing hot water pipes. They are in use in the greenhouses connected with the asylum for the insane here. They use but one ring to each joint. W.

Nitrate of Soda.

Have any of the readers of the FLORIST had any experience in the use of nitrate of soda as a fertilizer on roses or other plants? If so, in what proportions was it used and what were its effects? W. S.

"FIFTY CENTS worth of fresh and pretty white roses" was a holiday mail order received by Florist P. H. Therkildson, Ironton, O., from the daughter of a millionaire. She generously offered to pay the express charges on same herself. The envelope which brought this order bore 4 cents postage, as befitting so important a communication.

LILUM HARRISII AT CHRISTMAS.—Will some one tell us how Lilium Harrisii should be handled to have blooms at Christmas or New Years. READER.

THE EXECUTIVE COMMITTEE of the Society of American Florists will be in annual session in Boston when this issue reaches our readers.

THE ANNUAL REPORT of the Nebraska State Horticultural Society has been received from the secretary, Mr. G. J. Carpenter, Fairbury.

News Notes.

OTTAWA, ILL.—F. J. King is very ill at his home in this city.

MOBILE, ALA.—M. Minge added a new house 18x100 this fall.

WEBSTER, MASS.—Eugene O'Hara succeeds Fairbanks & O'Hara here.

ST. LOUIS.—C. A. Kuehn has removed his wire works to 1122 Pine street.

ROCKFORD, ILL.—Mrs. H. W. Buckbee is spending the winter in California.

FT. SCOTT, KAN.—Anna S. Patterson has opened a floral store at 115 S. Main street.

NEW YORK.—Messrs. Peter Henderson and J. N. May are both down with La Grippe.

NORTHBROOK, PA.—E. P. Benard has started into the florist business in a small way here.

PORT HOPE, ONTARIO.—Florist E. N. Mitchell's only son was drowned Christmas week.

HORNELLSVILLE, N. Y.—A. J. Plimpton, of the firm of Plimpton & Miner, florists, died January 2, aged 59 years.

MILWAUKEE.—The monthly meeting of the Wisconsin Florists and Gardeners' Club was held at No. 1 Grand avenue on the 7th inst.

MR. JOHN THORPE has just recovered from an attack of malaria which confined him to the house for a week and has kept him under the weather for some time.

SOUTH ORANGE, N. J.—Joseph Bradbury has added a new house 20x225 to his already large glass surface. Hot water is used for heating. His roses are in as fine condition as one could wish.

PHILADELPHIA.—The firm of M. M. Bayersdorfer & Co., manufacturers of and dealers in florists' supplies, has been dissolved, Mr. M. M. Bayersdorfer withdrawing. Messrs. Harry Bayersdorfer and Paul Berkowitz will continue the business under the firm name of H. Bayersdorfer & Co.

MONTREAL.—The annual banquet of the Dominion Commercial Travelers Association came off in the Windsor Hotel a few days ago. About three hundred sat down. The liberal sum of twenty-five dollars was spent on a plant and flower decoration, button holes, etc. How is that for a holiday order?

KANSAS CITY.—Robt. S. Brown & Sons will close their store on Main street February 1 and hereafter handle all their trade from the greenhouses at 13th and Wabash avenue. The city has grown out to the greenhouses so that they are now almost as convenient as the store to most of their patrons, hence the change.

LITTLE ROCK, ARK.—Owing to remarkably warm weather for the season roses were beginning to get ready to bloom outside when along came a cold snap which nipped them in the bud. For three weeks preceding Christmas the weather was very warm, the thermometer registering as high as 80° on some days and 75° on some nights.

ERIE, PA.—The Erie Chrysanthemum Club has effected a permanent organization and elected officers as follows: President, E. Brewer; Vice-Presidents, H. Tong, H. Niemeier, Wm. Thompson; Secretary, L. H. Conser; Corresponding Secretary, H. Tong; Treasurer, Henry Niemeier. Executive Committee, John Roberts, Wm. Honeysett, E. Neulberger, Chris. Wolf, Bernard Schlandecker, John Miller, G. L. Moody and J. Busceck.

DALLAS, TEXAS.—At Christmas time the weather here resembled that of August. All the plants are growing out of doors; tea roses have made a fine crop of new wood and are all set with buds. Peach trees are swelling their buds, Roman hyacinths and paper white narcissus were in bloom out of doors on Christmas day. A sudden cold spell would give everything a terrible set back. J. M. Howell has opened a cut flower store on Main street.

BALTIMORE.—The Baltimore Cactus Society was recently organized in this city by lovers of these plants. The society has 32 members and officers as follows: John A. Becker, president; Geo. A. Kern, vice-president; Fred C. Reincke, treasurer; Rev. N. Burkhardt, lecturer, and Fred W. Lantz, secretary. The society will promote the cultivation of cacti, and will give annual exhibitions, if possible, in connection with the Maryland Hort. Society. Some of the members of the society have been engaged for several years in the cultivation of cacti, and already have collections of from 200 to 500 distinct varieties.

THE "PLANET JR"

HORSE HOE has a world-wide fame, and its hosts of friends
will be delighted with its improvements for 1890. First
LEVER EXPANDERS in action, firm,
strong, simple, accurate, perfect.
HANDLE ADJUSTMENT—Silence and for height. Quick, stiff,
grand for grapes, corn and in covering
PARALLEL FRAME Standards, interchangeable, STURGEON
patent, CONVENIENT, invaluable.
We absolutely guarantee our 1890 Horse Hoe and combinations,
and now patented features to please every practical farmer and
gardener, and their money value to be far greater than ever.
Look at it, and write us. Catalogue free. The "PLANET JR"
Hand SEED DRILLS, Double and Single Wheel Hoes, etc., etc.
"Fire Fly" Plow, &c., are indispensable to farmers and gardeners. They meet with regularity any thick-
ness and depth, difficult and easy seeds in small or large quantity, and without danger to vitality and with-
out special care. In market gardening the Wheel Hoes, save their cost every few days. The "Fire Fly" Garden
Plow is a delight in the family vegetable garden. The "Planet Jr." combined Seed Drill, Wheel Hoe, Cultivator
and Plow combines in an admirable way the qualities of all the rest; being delightful as a Seed Drill, Double
Wheel Hoe while plants are small, Single Wheel Hoe, Cultivator—deep or shallow, and Garden Plow.
All the blades of these famous hand tools have long been made of hardened polished steel. Keep them bright and
sharp, and you will save the full cost every few days. Send for full Descriptive Catalogue of all our goods.
Write us your wants. S. L. ALLEN & CO., Sole Mfrs., 1107 Market St., Philadelphia.

The Public Want

Their seed fresh
and true.

Would they not be most likely to obtain such by buying
directly from the grower? I can buy seed at half
what it costs me to raise it, but could not sleep soundly
should I warrant seed of this class. For the same
reason I make special effort to procure seed stock
directly from their originators. You will find in my
new seed catalogue for 1890 (sent free), the usual
extensive collection (with the prices of some kinds lower
than last season) and the really new vegetables
of good promise. You should be able to get from me,
their introducer, good seed of Cory Corn, Miller Melon,
Hubbard Squash, All Seasons and Deep Head Cabbages and
many other valuable seeds, which I have introduced.
JAMES J. H. GREGORY, Marblehead, Mass.

OF THE

UNITED STATES AND CANADA.

FOR 1890

WILL BE READY IN 10 DAYS.

Price, \$2.00.

SEND IN YOUR ORDERS NOW.

The new book is a very great advance upon the old one, as we have covered the
whole country by correspondence and obtained original lists of those in the trade in
every city and town in the United States and Canada. We believe that the list is
now as nearly correct as it is possible to get it.

AMERICAN FLORIST CO., 54 La Salle St., CHICAGO.

Mandevilla Suaveolens.

This is a native of South America, introduced by H. J. Mandeville in the year 1837, and named after him.

A fine deciduous creeper bearing white convolvulus-like flowers which are very fragrant and borne in clusters of three to five. The plant is but little known, but ought to be in every collection.

In the east it would require warm greenhouse treatment and is best grown in a large pot or box and trained as a pyramid.

In Southern California it is quite hardy and blooms from May till August when it is a grand sight. There are specimens in this town very fine.

Santa Monica, Cal. H. S. LEGRAND.

A Query.

Would some one be so kind as to give me a list of the best 25 Japanese chrysanthemums, new or old, for growing as bush specimens for exhibition.

Also how to prevent or destroy a small beetle that eats the center buds out. I had them so bad last summer as to spoil many of the best plants. They commenced about August. J. L. Oshkosh, Wis.

Maybe He'd Never Tried.

Managing Editor: You say here that you have cultivated hothouse lilac bushes that have attained a height of over fifty feet?

Horticultural Editor: Yes, why?

Managing Editor (musingly): Nothing, only I wish I could lilac that.—*Thomas Siftings.*

Foreign Grape Vines for Graperies.

Splendid 1 and 2 year old vines, true to name, grown by an expert. List of varieties and prices mailed on application. HENRY A. DREER,
714 Chestnut St., Philadelphia, Pa.

Philadelphia.

Mr. H. H. Battles, of Evans & Battles, has been very ill with pneumonia. His life was despaired of at one time, but the crisis has been safely passed and he is now on the road to recovery.

Messrs. LaRoche & Stahl, the well known florists and commission merchants of 13th and Chestnut Sts., have finished their new rose houses at Collingdale, on the B. & O. R. R. The greenhouses are built on a 10-acre lot within one half square of station; this land was recently purchased by the firm. Their old plant, which was known as being at Sharon Hill, will be moved next season to the present site. The arrangement of the new houses are something different from what are being built in this vicinity. There are five houses in one block facing east and west; each house is 20x100, equal span; the gutters are six feet from level of walks with a foot walk at north end. You can go from one house to the other without going outside. The heating is done by steam, one large return tubular boiler is used. The piping arrangement is both overhead and underneath, two 1½-inch flow pipes overhead, and six 1-inch returns underneath; there are eight pipes in each house, four on each side; on each side there is a valve so that one or both sides can be used. The water system is very complete, a large well under the boiler furnishing all the water, which is pumped up by an engine direct from the well and then through the greenhouses with a connection in each house. One great advantage of having the well under the boiler is that the water is always warm. There is a large work room 20x100 at north end of the houses. This room is filled up with all kinds of machines and tools to do plumbing, carpenter work and everything else that is needed about greenhouses. Mr. LaRoche has also built a handsome residence on the new site. The house is lighted by thirty-five electric lamps by his own plant, the engine that is used for pumping at greenhouses furnishes the power.

Boiler Scale.

Compelled to use hard water we were always troubled with scale, especially on the tubes of our boilers. It would destroy the tubes in less than three years. Last fall we tried some of Weldon's economical boiler compound, and find no scales on either tubes, boiler or hot water pipes. We are sure it will reduce our boiler and coal bills. SCHILLER & MAILANDER, Niles Center, Ill.

MANURE exposed to the action of the sun, rain and snow will lose more of its value than would pay for the erection of a good shed to cover it. It will rot quicker and be in better condition for the plants to assimilate if kept under a shed and worked over occasionally also. B.

COMMERCIAL NURSERIES, ANNAN, SCOTLAND.

We offer for spring shipment, a large and carefully cultivated stock of Norway Spruce, Austrian and Scotch Pines, Norway Maple, Silver Birch, Scotch Elm, European Alder, Ash, Beech, Linden, Laburnum, Mountain Ash, Purple Beech, New Golden Maple and Elms, Golden Spiraea, Golden Silver and Cuck-leaved Elders, Rhododendrons, Roses, Gooseberries, etc., etc. All sizes of No. 1 quality, at lowest prices. JOHN PALMER & SON,

To Have THRIVING PLANTS Use ECLIPSE FLOWER DRESSING. Makes rich foliage and abundant bloom. Inset that your Seedsmen furnish "Eclipse," for send 50 cts. for sufficient for 20 plants for 1 year. Mention this paper. J. P. THOMAS & SON Co., Philadelphia, Pa.

HUGHES

SOLUBLE FIR TREE OIL.

FLORISTS AND NURSERYMEN SHOULD NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants; such as ferns, etc., if used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

It kills insect life on man, animal, or plant, without injury to the skin, where parasites may appear.

Rooted Cuttings.**YOUR TRADE SOLICITED.**

CARNATIONS.—All sold but HINZE'S WHITE. May have some later. Watch this ad.
FUCHSIA.—MRS E G. HILL, PHENOMINAL, STORM KING, and others.
COLEUS.—Have a 100 foot house filled with Stock Plants of twenty-two good bedding varieties at 60 cents per hundred; \$5.00 per thousand.
SMILAX AND PANSIES.—Plants once reset, nice and stocky, at 75 cts. per 100; \$6.00 per 1000. These won their way to favor last season, will have treble the quantity this, and solicit a trial.
CANNA EHEMANNII.—\$1.50 per dozen; \$10.00 per 100. Send for Complete List.

With an extra large stock of Coleus and Hinze's White Carnation I am prepared to quote low prices on rooted cuttings of either in quantity. Write and see what I can do on any of the above. **ALBERT M. HERR, Lock Box 338, Lancaster, Pa.**

CARNATION BLOOMS.

A full line of fancy colored, long and short stems. I make a specialty of shipping long distances A full line of **ROOTED CUTTINGS** of standard varieties, now on hand, at reasonable prices
NEW PINK CARNATION "CHRISTMAS."

The company of Grace Wilder. I will now sell Rooted Cuttings of it at \$5 per 100; sent safely by mail. Sample blooms mailed on receipt of 15 cts.

CHAS. T. STARR, AVONDALE, Chester Co., PA.**New White Carnation,
LIZZIE MCGOWAN.**

This Carnation is a cross between Hinz and Peter Henderson, it is pure white, fringed, and very fragrant; all of the flowers are on long stems. The flowers measure from 2½ to 3 inches AN. IT DOES NOT HEART. Its habit of growth is similar to that of the Dew. It is the freest rooter I have ever seen. It will produce more flowers than any other white in the market. I know it to be the best shipper and keeper in the market—I have kept the cut flowers from 10 to 15 days.

WHAT JOHN N. MAY SAYS ABOUT IT:

SUMMIT, Dec. 6, 1889.
 MR. JNO. MCGOWAN, Dear Sir:—I consider the Lizzie McGowan Carnation the best white in cultivation.
 J. N. MAY.

I have only got a limited quantity to sell; all the plants are in 2½-inch pots. Orders filled in rotation.
 Plants Ready March 15, 1890.

You Can't Afford It.

You can not afford to throw away or waste wood ashes; to expose manure to the action of the sun and rain; grow weeds; raise inferior plants; keep poor unremunerative stock; use poor seed; let boards, nails, glass or tools get out of place or broken; let your neighbors grow better flowers and plants than yourself; neglect your mental culture; think that you are smarter than your neighbors; not to keep a set of books; be ignorant of the topics of the day; let insects eat your plants and flowers without making a prompt practical protest; neglect thorough cultivation; have a dirty house or shed; expect to gather figs from thistles; to let others think for you; or to keep foul-mouthed, bad-principled men about the place.

A. B. C.

HAVE you put away the tools that you have used during the summer? Are they all in good order? Are those that need painting painted? If not, why not? A.

HAVE YOU renewed your subscription for 1890? If not, please do not fail to attend to the matter now.

THE NEW TRADE DIRECTORY is now in the bindery and copies will reach those who have ordered same soon after this issue of the FLORIST.

CALLAS with DOUBLE SPATHES are still frequently sent to us, and for the information of the senders we would say that such abnormal developments are not rare, and of no special interest, hence it is a waste of postage to forward them to us.

TRADE LISTS most frequently go into the waste basket, the FLORIST is preserved for reference. Print your spring trade list in the FLORIST where it will be preserved and do you good much longer than a list mailed by you. Besides it will cost you less money.

The Executive Committee Meeting.

The Executive Committee of the Society of American Florists met in Boston on January 14-15.

Messrs. Halliday, Keller and Burton were unable to be present. All the other members of the committee were on hand, and Messrs. Robt. Craig, Edwin Lonsdale and S. Henshaw, who accompanied them, were invited to act as substitutes for the absentees. The treasurer's report showed a balance on hand considerably in excess of last year and the general condition of the society was found to be prosperous. Messrs. May, Calder and Henshaw were appointed a sub-committee with full power to have the Society of American Florists incorporated (probably under the laws of the State of New York) and to provide an appropriate seal for the society.

The subject of exaggerated illustrations in plant catalogues was thoroughly discussed and an effort is to be made to secure the co-operation of the Seed Trade Association in furthering the work of reform in this direction. Publishers of illustrated catalogues will be invited to send specimens of their publications to the exhibition at Boston in August in competition for the society's certificate of merit.

Another all-important matter that occupied much of the committee's time was the subject of "nomenclature." Mr. J. D. Reynolds, of Riverside, Ill., is chairman of the re-organized committee. The work will be prosecuted vigorously and a most interesting report on the matter may be expected at the convention next August.

It was decided to provide for a competitive display of standard pots, and a certificate of highest merit will be awarded to that collection which nearest approaches the standard. Each exhibit must consist of not less than one dozen of each size, made from working molds and not turned down.

A large amount of material for essays and discussion was submitted and a splendid selection of subjects was made. The list includes Landscape Gardening, Entomology, Hybridization, Horticultural Chemistry, System in Business, Easter Trade, Hardy Herbaceous Plants, Aquatics, etc. These subjects have been assigned to gentlemen of ability whose names will be given at a later date. A large number of interesting and practical enquiries were also received for the Question Box, most of which were also assigned to persons competent to reply to them. A few were left open for general replies.

It was decided that a uniform rental of 25 cents per square foot for floor space in the exhibition hall should be made to all exhibitors regardless of the nature of the goods shown.

The gratifying announcement was made

that the Mass. Hort. Society had arranged to hold its annual exhibition of plants and flowers during the time of the convention. Liberal premiums will be offered and in this exhibition competition will be open to all, free of any entry fee.

The committee decided to appropriate on behalf of the Society of American Florists, the sum of \$100 to be devoted to premiums for table decorations, to be competed for at this exhibition.

The headquarters of the society will be at the Tremont House.

WM. J. STEWART.

—The Executive Committee S. A. F. met promptly at the Tremont House at the usual hour and attended so closely to business that by the following evening they had the programme for summer convention mapped out and all work cleaned up in time to go out and bowl up an appetite for the banquet to which their Boston brethren had invited them. As the FLORIST will have a full account of the meeting from another hand I will not go into details except as to one point, a point on which I hope not to be considered a crank, viz.: catalogue illustration.

It will be remembered that the report of the sub-committee on this subject was at the last summer convention after full discussion accepted and referred to the executive committee with power to act. But alas, the latter saw so many snags in the way that they deemed it inexpedient to carry out the main suggestions in the report, contenting themselves with the very mild and safe measures of inviting co-operation from the seedsmen's association, and also inviting publishers of illustrated catalogues to send in sample copies as an exhibit at the next convention with the understanding that certificates of merit shall be given to the honest ones. This is very well, but it is not enough. I shall not accuse my colleagues of timidity, but somewhere in this Society of American Florists there is timidity, and a good deal too much of it. It is the same here as with nomenclature and every abuse which the society has been asked to correct. There is a dreadful fear that if any really aggressive measures are taken we may get into a row with some one. Well I say let us get into a row if necessary and the sooner the better. By all means let us take all possible precautions against doing injustice to any innocent parties, but there certainly are guilty parties and we are a poor set if we can not devise measures to ferret these out and when found kick up just as big a row as they are willing to join us in.

It was said at the executive committee meeting that the catalogue men are quite indifferent to our puny vapors and would treat with serene contempt any offer we might make to certify as to the faithfulness of their cuts.

This I think is an error. Since the committee adjourned I have found at least one catalogue man, and I don't know why he should not be named, Mr. R. Farquhar, of Boston, who would be glad of our countenance and support in his attempt to dispense with exaggerated illustrations and who has promised to champion the cause of reform at the Saratoga meeting of seedsmen in June. From this able championship I expect results that will shame us out of our hesitating policy.

I firmly believe that the majority of my fellow men in every trade are honest men, that certainly the catalogue men are no exception and that a majority of them will gladly welcome the opportunity to range themselves on the side of fair dealing without misrepresentation of any sort, and will be glad to have the line drawn as sharply as possible between themselves and their unscrupulous competitors.

The sub-committee on catalogue illustrations was but feebly represented at Boston. But one member was there and he found the preponderance of opinion against him. But he believes that the great majority of members of the S. A. F. are with the sub-committee in this matter and has confidence that they will again be endorsed and encouraged to continue the work at the next convention.

JAS. D. RAYNOLDS.

After Adjournment.

The Gardeners' and Florists' Club of Boston, most royally entertained the executive committee S. A. F. at the Tremont House on January 15. The management and arrangements were perfect; the *cuisine* unexceptionable, the speeches called out by toast-master A. P. Calder were short, to the point and for the most part witty, and the decorations, due to the lavish generosity of members of the club were simply superb. It would be cruel to invite the readers of the *FLORIST* to a Barmecide feast so the menu will not be reproduced but the S. A. F. is to be congratulated that the Tremont House has been selected as headquarters next summer, for it is right there that one can get good things to eat at every meal as well as at formal banquets.

But it will be of more interest to tell of the decorations than of a feast that has been eaten, and the decorations were a feast in themselves. The walls were tastefully decked with smilax, asparagus, etc., and around the sides of the room were great laurels reaching nearly to the ceiling, and many fine palms; especially noticeable was a *Cocos Blumenia* furnished by Mr. Becker, said to be the only specimen in the country. On the table were three pot specimens of Norfolk Island Pine (*Araucaria excelsa*) looking so absolutely clean and fresh that it was difficult to believe they had not been that day lifted from their native soil. Then there were great baskets overflowing with roses, tulips, etc., and one contributed by Mr. Harris that was a marvel for the number of rare and beautiful flowers it contained. Rising prominently from the center were scarlet lapagerias, among them one distinctly double and believed to be unique, surrounding these were orchids in splendid profusion, *Calanthe Veitchii*, *C. vestita*, *Calogyne cristata* and *exipriedipendula* of a variety found only in Mr. Harris' collection. Then there was *Bignonia venusta*, *Bougainvillea spectabilis* and other things too numerous to mention, while around the edges drooping gracefully to the table were sprays of *Acacia pubescens*. The

other flowers were left behind and divided with hilarious joy among the waiters and kitchen maids who came trooping in just as the banqueters left the hall, but Mr. Harris' basket was carefully preserved for photographing and it is to be hoped that a successful reproduction of this thing of beauty may be had to grace the pages of the *FLORIST*.

After the banquet, which certainly lasted till bed time, it is said there was an adjourned session in one of the parlors of the hotel lasting till nearly getting up time, but this can hardly be since the guests were on hand bright as larks for early breakfast, and some of them piloted by that genial old-school gentleman Patrick Norton took an early train for Natick to see the famous rose houses of E. M. Wood. Here was found Mr. Alex. Montgomery who has been in charge for many years, and here were found rose houses built just as they ought to be—if only it did not cost so much. Side walls, partitions, walks and even bench supports are all of Portland cement concrete, affording absolutely no harbor for insects, making the work of keeping the houses clean and tidy a delightfully easy one, and leading the visitor to have a sigh of regret that such construction is quite impracticable for the florist of ordinary means. Some of the houses were built for other than their present use and have roofs of so steep a pitch that the center benches are eight or ten feet from the glass, yet the roses in these benches seemed in perfect condition, differing in no wise from those on the sides whose stems grew within a foot of the glass.

Mr. Wood does no fumigating but keeps down greenfly by evaporating tobacco water on a plan somewhat different from Mr. Palmer's. He has iron troughs eight feet long by five inches diameter through which run steam pipes; quite like the evaporating pans for 4-inch water pipe with which we are all familiar. In these troughs broken tobacco stems are placed and covered with water; this seems a convenient arrangement, perhaps more so than steeping the tobacco elsewhere and carrying the liquor to the pans.

Of the roses grown here aside from hybrids, *Mermets* and *Brides* largely predominate and are of the finest quality. One bench of *Cornelia Cook* was seen, 300 feet long, a perfect bank of great white buds such as used to be seen a dozen years ago, but are very rarely met with nowadays. Mr. Montgomery has been trying Dixon's so-called yellow *Mermet* but the buds so far developed look like a rather poor *Bride* trying to revert. It has however a "red *Mermet*" (something which a good many of us have been trying to fix) which he says has proved constant for two years and promises to hear about the same relation to *Mermet* that Albany does to *La France*. No blooms of this sport were seen however.

Mention must not be omitted of a feature that was the first thing to strike the visitors, viz.: The tool room, and this was in the business office. Imagine a great board perhaps 4x8 feet in size fixed against the wall and covered with beautifully clean, even polished steam-fitting tools looking like nothing so much as the exhibit of a tool making firm at some exposition. Each tool has a number and behind it a black silhouette of itself painted on the board so that it can be instantly known, if any space is vacant just what tool is missing. After this the visitors were quite prepared for the evidences of careful and orderly management everywhere apparent in this model establishment.

Returning to the depot in the carriages placed at their disposal by the courtesy of Mr. Wood, the party took the noon train for Boston and there dispersed to their several ways. One would like to close this article by mentioning the name of each kindly Bostonian who gave up his time and devoted himself to looking after the convenience and entertainment of the visitors, but the list would be too long, and to mention any names and not all would be invidious. Suffice it to say that the members of our craft in Boston and vicinity outdid themselves in hospitality and made for themselves, one and all, as many lasting friends as there were members of the executive committee.

J. D. R.

OBITUARY.

PETER HENDERSON.

The telegraphic announcement through the public press of the country January 18 of the sudden death of Mr. Peter Henderson was a great shock to thousands of his friends and acquaintances, and especially to the trade. Occupying so long in his own strong individuality a front place in horticulture, his loss will not quickly be forgotten or his memory fade. Hundreds of times have we heard attempts to belittle Mr. Henderson's success; how faulty his judgment, how much assistance was given him in his books or business, and how little of his vast enterprise was really of his own directing. In vain, it only added to the great reputation of him whose name stood at the head of his mammoth business. How great indeed must have been that ability that it could overcome the real errors, the jealousy of competitors, the hundred pitfalls in a long career, and in addition win financial success far beyond all competitors. The story of this poor Scotch boy suggests and fairly meets in romance the story of Melnotte, the Italian gardener's son, who wrested fame from those

"Twin jailors of the daring heart
Low birth and iron fortune."

for he has in our every day working world won the highest place. Truly "Peace hath her victories no less renowned than war."

Exactly four years since the *FLORIST* printed his portrait with biography, Vol. I No. 11. We have received from many friends of Mr. Henderson notes of general interest and condense some of them below. We give the first place to a letter from Patrick O'Mara, who as he writes us, has been in Mr. Henderson's employ as man and boy for 17 years; he says:

"At half past ten on the morning of January 17, in the 67th year of his age, Peter Henderson, the acknowledged Nestor of the florists and seedsmen in the United States, passed away. On Saturday, January 4, he was attacked with influenza, which a week later developed into pneumonia, and which despite the best medical attendance, coupled with the most assiduous and affectionate care of his wife and family, eventually proved fatal. Even during the last few hours of his illness, though his life hung in the balance, yet his family and friends hoped against hope, believing that his vigorous constitution, sustained by the temperate habits of his whole life, would finally triumph over the dread destroyer. But

PETER HENDERSON

it was not to be; the immutable law of mortality sooner or later forces the highest and lowliest alike to bow to its decrees, and, like a child going to sleep, he passed over to the silent majority. The detailed story of his brilliantly successful career, how as a youth of 18 he won golden honors in his native Scotland for his work as a botanical collector and classifier, and how he started in the market gardening and florist business in Jersey City, with limited capital but with unlimited energy and ambition; and how, with remarkable clearness of judgment on all vital questions, aided by an indomitable will, he overcame all obstacles and gradually forced his way into the front ranks, teaching others as he went, remaining a leader up to the hour of his death; this, as well as his wonderful success in the seed business, is already known to the most of your readers and will no doubt be faithfully told in the columns of the *FLORIST* by those familiar with his useful and busy life. One paramount cause of his uniform success may be discerned in the fact that he was never deluded into following an *ignis fatuus*, but with keen penetration always saw the true course to pursue and followed it with unswerving purpose, yet was he always open to conviction and never despised counsel no matter how humble its source. While all about him admired the rare qualities which made him the successful business man and gifted author, yet now that he has gone from among them their minds revert more forcibly to that other phase of his nature whose

generous impulses attracted and held the affection of all who were brought into intercourse with him. The relations existing between him and the older and more trusted of his employees fitly illustrate the kindly and unselfish motives which were the cardinal features of his character. Although he never forgot, nor allowed others to forget the dignity of his position, yet in a measure he identified himself with them and when they were in sickness or in trouble his earnest sympathies were aroused and his substantial aid with his invaluable counsel were always at their disposal. No wonder then that he was regarded with an affection almost filial by the younger portion, or that the older of them feel that by his death they lose a friend who can not be easily replaced. His ear was always open to the tale of the distressed, and when his hand was extended to them it was never empty. No one ever asked his advice in vain, even though it was in the busiest moments of his ever busy life, and his daily correspondence was never without an answer to some one needing his counsel. Many a florist has been sustained by his words of cheerful encouragement, and many a young man has been started on a prosperous career by his sage advice. A gentleman in the broadest sense of the word, chivalrous and kind, he was always so considerate of the rights and feelings of others that he would not wantonly offend a child, and even to the last he was more mindful of the comfort of those around him than of his own. Be-

nevolent in a marked degree, faithful to his friends, firm in his ever rightful purpose, never allowing passion to sway his deliberate judgment, equal to every burden which circumstances placed upon his shoulders, a loving husband, a kind and indulgent father, with nothing lacking to make him a peer among his peers, friends and country might well feel proud of him and sorrowing weep for his loss.

Though vanished from our midst we hold him dear.

And mourn his loss with true affection's tear
His kindly spirit with us long will dwell,
Although we bid his clay a sad farewell.

Mr. John N. May writes:

In every department of his vast business Mr. Henderson always exercised great care and judgment, and while he was a shrewd business man he was also exceedingly liberal to his employees, and always generous where liberality was deserving, kindly and courteous by nature, yet no man could detect an imposition quicker than he could. His death will leave a gap in our profession which it will take a long time to fill; he will be deeply regretted by hundreds of sincere friends in the florist business all over the country. A sad fact in this connection is the illness of Mr. Alfred Henderson who is in Richmond, Va., whose physicians will not permit his return at present.

Another well known seedsman and florist says:

Peter Henderson has left a gap that will remain a long time unfilled, as he had a combination of gifts trained by long usage that became immensely valuable to him, and marked him and his business distinctly from all others. Vick had an individuality strictly his own. Many firms and leading men in the trade we see around us have methods and ways peculiarly their own, but we do not look at them as individuals, but as firms who do so and so from year to year. Peter Henderson gathered the threads of trade in his hands, passed them to his business machine and they never lost the impress of Peter Henderson. Just why it would be hard to say. He could not be said to be the greatest seedsman, the greatest grower, florist or market gardener. But he was a remarkable man. He struck the chord of sympathy and fellow feeling with his craft and with the public early in his career, and kept it up until his last day. At his greenhouses till noon each day he held almost a levee, florists, gardeners, amateurs all received a kind word—advice, encouragement, sympathy and interest to all. Showing them through the greenhouses, taking orders on the go, and above all taking the liveliest interest in his visitors, their business and his, he passed a busy forenoon. Arriving at the store about 1 he was confronted with a stream of callers, a large mail of personal enquiry and advice beside the regular business. Talking to callers, dictating to stenographers. Always pleasant, always ready with a good word for every one. His visitors came in contact with him, rolled away in the sea of humanity carrying the pleasant waves of memory with them and to many of like interest. He was strictly business, but still liked humor connected with his business, whether it told against him or not. Some 25 years ago when my cousin wrote him that a wet nurse should have accompanied the plants he sent because they were so small, he took delight in sending others that did not need this attention and remembering the writer thereafter. Some wondered why he so persistently auctioned plants each year. They forget that years ago when he used to bring

over plants to sell on the sidewalk in New York he usually wound up with a small auction towards night. We don't blame him for keeping his early days and early methods green in his heart.

Emily Louise Taplin in a very interesting letter says:

Soon after his start he began writing for the few agricultural and horticultural papers then in existence here. Among others was a small monthly managed by the elder Hovey, of Boston—a paper long since dead. Mr. Henderson sometimes related with amusement his first meeting with his august editor, who called in Jersey City to see the unknown contributor, whose articles showed such practical knowledge and vigor. When he arrived the famous nurseryman of the future was handling fork and spade in his garden with the practical vigor he showed in handling his pen, and he was a little amused when the visitor asked him with dignity to find Mr. Henderson and tell him Mr. Hovey wished to see him.

His first book, "Gardening for Profit," was brought out while he was in the market gardening business; it has been revised and has passed through several editions. Later he published "Gardening for Pleasure," which was also successful, as was his "Handbook of Plants," and "How the Farm Pays," which was written in collaboration with Wm. Crozier. Mr. Henderson's work on this book was done during some weeks when he was unable to be actively engaged in consequence of an accident.

He enjoyed superb health up to the time of his last illness and he always spent three or four hours a day in the open air. Though encumbered with the many cares attached to such a vast business, of which he was the mainspring, Mr. Henderson never seemed worried or harassed; his was emphatically a sound mind in a sound body. His ceaseless activity never seemed toilsome, and he enjoyed life fully. Though thoroughly abstemious in his habits he was fond of social intercourse, and his wide knowledge, keen observation and shrewd but kindly speech made his conversation both entertaining and instructive. The writer never heard him say an unkind thing of any one; if he expressed disapproval it was done in such a way that it left no sting behind. Mr. Henderson modestly ascribed his business success largely to two things—his temperate habits and the liberal use of printer's ink. He studied advertising as a science, so that his name has become a veritable household word, and he always appeared to foresee any business demand in time to supply it. In the trade Mr. Henderson was actively interested in the American Seed Trade Association, the Society of American Florists, the New York Horticultural Society, and the New York Florists' Club; he was also identified with various undertakings in Jersey City, and was known as a man of unostentatious liberality.

His funeral, which took place January 20, was very largely attended, most of the prominent florists, growers and seedsmen of New York, Philadelphia and adjacent points being present, as well as Mayor Cleveland and other prominent citizens of Jersey City. A quantity of beautiful flowers adorned the casket. Mr. Henderson leaves a widow, two sons, who were his business partners, and a daughter, Mrs. Robt. Floyd, a lady of literary accomplishments, author of some charming magazine verse and short stories.

The world in general knows Peter Henderson as one of the most active, farsee-

ing and prominent men engaged in horticulture, but those who had the privilege of his friendship will remember him as a man just and upright, firm faithful and genial, whose friendship was unwavering and whose justice was always tinged with mercy.

John Thorpe says briefly but strongly:

Mr. Henderson's death has made a great breach in horticulture. For without any question he was the peer of all his brethren, he was a man who to be acquainted with was an honor. To have his friendship was worth more than gold. To obtain his advice was to possess jewels. In his demise the people of America have lost the casket and the jewels, for who had more acquaintance, more friendship, or who gave more sound advice?

Philadelphia.

January 21 was the 61st anniversary of the Pennsylvania Horticultural Society, and on that date Mr. George W. Childs, the newly elected president of the society, took his seat. The meeting was very largely attended, among those present being representatives of the New York Florists' Club, the Society of Indiana Florists, the Germantown Horticultural Society, and florists from New Jersey, New York, Washington and Delaware. It was made a gala day by the florists, who had elaborately decorated the rooms at Horticultural Hall for the occasion.

Mr. Robert Craig, one of the vice-presidents of the society, made a brief address introducing the president elect, who in his address stated that the society was, he believed, the oldest institution of the kind in the United States, going back 60 years and having a most creditable history. He named the eminent Philadelphians who were among its founders and had been its presidents since, making special mention of Mr. William L. Schaffer who occupied the chair for 17 years, and said that the action of the society in electing him to succeed such distinguished citizens was a very acceptable compliment and an honor he highly appreciated, and concluded as follows:

"The society has held sixty autumnal exhibitions, many hundred monthly shows of plants, flowers, fruits and vegetables, and has distributed nearly \$40,000 in premiums. During the last quarter century there has been a largely increased interest in horticulture, and there should be a corresponding increase in the scope and usefulness of our society. It will be a pleasure to me to co-operate with you in the promotion of that object in every way in my power."

At the conclusion of Mr. Childs' address Secretary Farson read several letters from sister organizations including the Society of Indiana Florists, the Gardeners' and Florists' Club of Boston and the Florists' Club of Philadelphia, all accompanied by handsome baskets of flowers. Flowers were also sent by the New York Florists' Club and the Chicago Florists' Club.

Dr. Reed made a short address expressive of his sincere gratification at the election of Mr. Childs as president. He made a graceful reference to the meeting of the Society of American Florists in this city three years ago, on which occasion they were elaborately entertained at "Wootton," the country residence of Mr. Childs. He referred to the great advancement of horticulture during the past few years, and spoke of the many magnificent private collections which exist in all parts of the country. He prophesied that with Mr. Childs as president, the Pennsylvania society would soon stand at the

head of similar societies in the country. He thought the society should place a high value on the acceptance of the office by one who had been thought fit by his fellow citizens to occupy the highest office in civic life. He is a man, said Dr. Reed, who has said little and done a great deal; of few words and great works; whose name is cherished in every section of this large domain; is almost a household word in every section and is revered and beloved by us all. The society should congratulate itself that one endowed with so many gifts, so slow to accept, but deserving all honor, should have accepted this post.

Congratulatory remarks were also made by Wm. F. Dreer, M. A. Hunt, president of the Society of Indiana Florists, and Chas. H. Miller, landscape gardener of Fairmount Park. Regarding the display Mr. Miller said: "I never saw a small collection with so many rare and choice flowers."

A large number of special premiums for the next chrysanthemum show was announced and ten new members were elected.

The exhibition of plants and cut flowers, although not large, was remarkable for quality. What was considered the choicest collection of plants was exhibited by David Emery, gardener to C. Dissel, of the firm of A. C. Yates & Co. It included rare and well-flowered orchids and other plants. Among the former was a large specimen of *Cyclopogon cristata* with nearly 100 blossoms, and a fine plant of *Dendrobium Wardianum*, with an equal number of flowers.

Mr. W. K. Harris exhibited *Lilium Harrisii* and his new late blooming chrysanthemum and Mr. John Wooding a group of cinerarias in good bloom. Chas. F. Evans exhibited orchids, and a large collection of cacti was shown by Mr. A. Blanc. A small but choice collection of ferns and orchids were from Henry A. Dreer, and the rare *Cattleya trianae* from Henry Surman, gardener to E. W. Clark. Craig & Bro. exhibited some magnificent roses; Pitcher & Manda, Short Hills, N. J., orchids; J. N. May, Summit, N. J., orchids, roses and mignonette; Wm. Swayne, Kennett Square, Pa., seedling carnations; Edwin Lonsdale, a fine collection of cyclamens; John Burton, a large assortment of roses, including the handsome hybrid *Ulrich Brunner*; and a remarkable exhibit for this time of the year, of hardy and wild flowers by John Bell and Mrs. Ingersoll.

New York Notes and Comments.

Some of the showy varieties of amaryllis have sold well in the flower market during the last two or three seasons. The light colored and striped hybrids do not seem to take quite as well as the solid colors, the well known *A. adula* platypetala being a favorite. It is not only a showy color, but is also so robust in habit; a good many of the others are apt to be weak in the stem. Around the holidays good spikes brought a comparatively high price. It is no trouble to grow, receiving the same general treatment as a calla; of course it needs plenty of water after being brought in. Some very fine specimens recently seen were 10-year old bulbs, they averaged two spikes to a bulb, with two great flowers on each spike. The best flowers were on bulbs over four years old; naturally they will keep on blooming for an indefinite number of years. As a rule, growers prefer single bulbs in a pot rather than masses as being more handy. Occasionally they are seen planted out in a bed,

THE PINK JAPAN ANEMONE IN THE GARDEN.

but like a calla, they seem more satisfactory in pots. With the eucharis, however, the case seems just opposite; the best result seems always obtained when planted out on a bench.

We still hear of many failures among hybrids, the result of poorly ripened wood. Roses generally continued quite poor during January, but although prices seem poor, it looks as if growers would not come out so far behind after all. It is a little surprising, considering the way violets have been ruined by disease for several seasons, to notice the tremendous quantity in the market this winter. It looks as if they were being grown to an unlimited extent with perfect success.

Last winter many of the store windows were banked with *Primula obconica*; this season it is hardly ever seen. It never seemed to take such a strong hold in New York as elsewhere, though it had plenty of advocates. Of course it is a dainty little thing, but when grown in a spindling fashion—which was very often the case—it was emphatically weedy, unless massed together so that individual plants did not show. A house filled with it, covered with bloom, was really a beautiful sight, but when the plants were separated, showing weak stems and small heads of bloom the charm was lost. It is very much the fashion to say that buyers here will not look at a flower unless it is as big and showy as a tiger

lily, but this is rather unjust. It is not very easy to introduce novelties, but if thorough tests show that they have commercial merit they are not long unrecognized. For example, the climbing asparagus; at first it was supposed that it never would take well because of the culinary suggestions of its name. Of course it has not swept snailish entirely out of use, or taken the place completely of any other green, but it is a good staple and is more likely to increase than decrease in favor.

Take another plant now coming into favor, the cyclamen. A few years ago cyclamen flowers were salable only to a very limited extent, partly because people were unfamiliar with them, and partly because really fine strains were little grown. Several growers imported fine varieties from Great Britain or the Continent, and now they have a regular place in the market. During this winter they have been quoted from \$1 to \$3 a hundred, and they certainly pay. They bloom profusely and are not troublesome. A marked improvement may be noted in the plants; the growers adopt the doctrine of the survival of the fittest, some of the finest flowers being pure dead white or deep crimson. The florists like them to use with orchid flowers, one decorator of excellent taste declaring them to be the only other flowers one could mix with this class, and unbotan-

ical flower buyers often ask if the cyclamen is not an orchid.

The annual dinner of the New York Florists' Club was set for January 18, but the lamented death of Peter Henderson would naturally disincite his friends for any social amusement. Like many others, he had recovered, as was supposed, from the influenza, going out of doors and thus caused a relapse. The writer had occasion to visit his place on January 10, and then learned that he was in bed, but not regarded as seriously ill. His death occurred on January 17, just a month later than that of his old friend, John Henderson. His death will be a shock to many, for though approaching the allotted age of man, Mr. Henderson's fine and rugged physique gave one the impression that he had many years of usefulness yet before him. In Peter Henderson horticulture loses its nestor, and many among us will have reason to lament an upright, firm and faithful friend.

EMILY LOUISE TAPLIN.

The Pink Japan Anemone in the Garden.

Every garden lover knows and has the fine white Japan Anemone. We think its very popularity tends to drive out the older forms. On a pleasant autumn day in the kitchen garden flower borders at Mirehouse, near Keswick, we were pleased to see the fine effect of bold and picturesque masses of the old pink form. It is a precious plant, as well worthy of a place as the white form, and has all the best qualities of a true hardy perennial. Our engraving is from a photograph kindly sent by Lady Jane Spedding.—*London Garden*

Notes From Boston.

The Florists' Convention to be held at Boston next August promises to be the most interesting and important meeting yet held by the society. The Gardeners' and Florists' Club of Boston and the Mass. Hort. Society are determined to make it so, and they have the material and the convenience to accomplish this end, and the whole-souled fellowship to render every stranger welcome and happy. Boston within and without is a city of gardens, and fine gardening is said to be better done, as a rule, around Boston than in any other city of our country. Certain it is that some of the oldest and grandest gardens in the land are in the vicinity of the Hub, and its magnificent private collections of orchids and other greenhouse plants are proverbial everywhere. The Botanic Garden at Cambridge, about five miles from the meeting hall, contains a very large collection of hardy herbaceous plants, and between one and two miles farther on is Arlington, the great seat of truck gardening. The Arnold Arboretum, about four miles on the other side of Boston, contains a larger collection of hardy trees and shrubs than can be found in any other arboretum in the world. And there are the famous garden cemeteries, Mount Auburn and Forest Hills, and all within six miles of the center of Boston.

In the florists' windows apart from roses, carnations, hyacinths, violets and the general run of seasonable flowers I noticed a good many orchid blooms in one Tremont street store and some bunches of purple lilac, English wild yellow primroses in bunches of about a dozen with a few leaves around them, scarlet nasturtiums bunched up in the same way, some spikes of *Eucharis Amazonica*, and in one (Doyle's) window quite a display of *Senecio Petasites* whose

ample panicles of yellow flowers had a very distinct and telling effect. This *senecio* is a very vigorous, tender perennial, not infrequent in botanic gardens and large private collections, but I shouldn't think quite good enough for general cultivation by commercial florists.

The bouquet of flowers that ornamented the florists' banquet table in front of President Jordan at Boston the other day was both rare and novel. It was made up of well flowered sprays of *Pyrus baccata floribunda*, white racemes of *Cassandra calyculata*, delicious bunches of mayflower (*Epigaea repens*) and charming little bluffs (*Houstonia coccinea*). A massive basket near by was made up with camellia blossoms cut with long leafy stems, topped with a crown of poinsettia and trimmed around the base with acacia, epacris and ferns.

In the corners and niches of the dining hall both standard and pyramidal tall plants of sweet bay (*Laurus nobilis*) were appropriately used. Their bright green fragrant foliage was a welcome help to the flowing palms. Mr. Becker, of Cambridge, had imported these bays from Europe last summer, and he tells me they didn't suffer any injury on account of the journey. He grows all his decorating plants in comparatively small pots for convenience in handling. W. F.

Souvenir de Wootton.

In response to your query as to how the "Wootton" rose is doing with us, we say, that it has been somewhat of a disappointment; we have had plenty of flowers during November and December, but they were very much inferior to Bennett and brought about only half the price. They are improving somewhat now, but it is not a first-class rose. We shall grow a limited quantity of it next year as it comes in useful as a cheap substitute for Bennett when the latter is scarce. ROBT. CRAIG.

—In reply to your query would say, that we bought 200 plants of the Wootton last March, gave them one of the best stands on the place; in September they were growing well and gave in early October a few fair blooms about as good as Papa Gontier. Since the bloom came off they got the black spot as bad as any rose in the whole list of hybrid teas, and to-day they have neither growth nor bloom. As a forcing rose it is a complete failure with us. Treated as a hybrid we think it will make a good pot rose for spring but nothing else.

B. P. CRITCHELL & Co., Cincinnati, Jan. 14.

—I read with surprise Mr. Whittle's comments on the Wootton rose. With me this rose is doing well, and I certainly grow roses under unfavorable conditions, as my rose house is small, heated by brick flues and is somewhat deficient in light. The Woottons, 200 in number, were planted from 3-inch pots the beginning of September, and though small plants they picked up considerably in a short time. The buds were pinched off until the begin-

ning of December and about the middle of December I cut the first buds, some as large as Bennetts, some the size of small American Beauties, and all well colored. The plants are entirely free from mildew and show very little black spot. If my other roses in the same house would do as well as the Woottons I would be well pleased. WM. H. WITTE.

Astoria, N. Y., Jan. 8.

—I received 100 plants of the Wootton about April 1 last and planted 50 on a bench in four inches of soil and 50 in a solid bed in another house in June. It is the most vigorous grower of any rose I ever handled, and more floriferous than any other I ever forced; it is deliciously fragrant, quite double—sometimes, free from mildew and black spot. But we want something else. The parties introducing it attribute to it all the good qualities desirable in a cut flower rose. "Color velvety red, equal to Jacqueminot." Of the thousands of buds I have cut, not one has had either the color or shape of the Jack. "It never makes imperfect buds." I have failed to get any perfect buds, although I have cut off small buds by the hundred to give the remaining ones a better show. "It retains its color for a long period." I rarely find two buds the same shade. They vary from a Hermosa pink to the color of a faded Bennett. True a bud will occasionally promise to come out a rather bright red, but by the time it is fit to cut it fades to a pinkish shade. This is my experience. I may not know how to grow them. Other parties may do better—hope they do. Would it not be the proper thing for the introducers to give us in detail the method by which they produce such magnificent buds.

Lancaster, Pa. GEO. W. SCHROYER.

—Regarding the Wootton will say: We have one hundred plants of this variety now blooming in our houses, and thus far we can certainly testify it is all that has been claimed for it; our plants were not planted until October, were very small, from 2-inch pots, and yet some of the roses produced rival the American Beauty in size and color, as you will see by samples sent. It is never out of bloom and of a strong healthy habit, and we are so much pleased with it that we will plant largely of them next season.

St. Paul, Jan. 22. L. L. MAY & Co.

[The roses sent were very fair blooms, though in quality considerably below those sent us by the introducer. They were terribly short of rivaling American Beauty, however, and from the comparison made we are forced to the conclusion that American Beauty does not do as well in St. Paul as at most other points. —Ed.]

—While the Wootton, with us, has not come up to what was claimed for it, yet it has been reasonably satisfactory. The first of the season we were troubled with a great many buds coming off color and malformed, but lately it has shown improvement in that respect, though it has plenty of black spot.

H. B. BEATTY,

Secretary Oakwood Rose Gardens. Oil City, Pa., Jan. 21.

—I think Wootton was at first much overrated and is now much underrated. It is extremely vigorous and has no blind shoots; the flowers are borne on long stems with very handsome foliage. On the other hand it seems to be the general experience that more than 50 per cent of the buds are either small or defective. But I have had enough good salable buds to make me consider it a profitable rose

to grow and I mean to grow it in larger quantity next winter.

JAS. D. RAYNOLDS.

Riverside, Ill., Jan. 23.

—Am disappointed in the Wootton. Chestnut Hill, Pa. EDWIN LONSDALE.

—The Wootton has not been thoroughly tried here yet, but at say Perle prices I think we can make a good market for it. Mr. Geo. Parker, who grows it here, is very much pleased with it.

Boston, Mass. W. J. STEWART.

—With me the Souvenir de Wootton is very free blooming and produces some very nice flowers. But for the New York market it does not take well; its shape seems to be the principal objection. But for the florist using his own flowers, and requiring a red rose, this variety will prove very valuable as it is one of the best constituted roses we have, and is exceedingly free; but to get good flowers it must be constantly disbudded, leaving one bud to each shoot; and if treated so fine buds with good long stems can be had. Another good feature of this rose is its fine foliage and beautiful fragrance.

Summit, N. J. J. N. MAY.

—In regard to Woottons, we hardly feel like giving an opinion. The general season has been so unfavorable for roses that they have hardly had a fair chance. The foliage is strong and rapid in growth, but buds are few and not very large. A few plants in pots have done better than those in benches. ELGIN ROSE CO.

Elgin, Ill.

The Best Six Roses.

In reply to W. C., page 231, the selection must of course depend somewhat upon circumstances. If they are wanted for local trade in a small town where cheap flowers only are wanted then I would advise the following: Bon Silene, Marquis de Vivers, Papa Gontier, Niphetos, Perle des Jardins and Souvenir de Wootton. But if the flowers are wanted to compete for good prices, or in other words, if really choice flowers are wanted then I would say: The Bride, C. Mermet, Mme. Hoste, W. F. Bennett, Mme. Watteville and Duchess of Albany, to which should be added for a place of any size, La France, Mme. Cusin and Sunset. This will give the grower a good variety of color and all are good roses.

There appears to be some difficulty with some growers in getting some of the above varieties in the best condition. Papa Gontier, to get it fine, should be grown in a somewhat cooler temperature than most of the others; Bennett on the other hand will do better in a slightly warmer temperature. Mme. Cusin and Mme. de Watteville should remain on the bushes till nearly wide open, then if cut and placed in water in a cool cellar for a few hours they are very beautiful and always meet with ready sale. Bennett should also be allowed to get nearly wide open before it is cut, particularly in cold weather. J. N. MAY.

The New Climbing Niphetos.

This is undoubtedly one of the finest roses of recent introduction. We procured it from England last June in the shape of an unripened cane without a leaf; however they were potted and treated carefully for about six weeks when they made a few leaves and were then transplanted into a solid bed at the warmest end of one of our rose houses. To our surprise they started to throw up

GLADIOLUS "SNOW WHITE"

thick shoots from the bottom and grew rapidly to a height of seven or eight feet, where they finished their growth by forming a cluster of from five to six buds, showing the habit of a true climbing rose. After these were cut off they started at every eye down the canes and threw out fine stems about 18 inches long at the end of every one being a bud. The flowers are large and of good form and substance, the foliage is exquisite, being of a very dark green color and large. The above description shows its great vigor, they have been treated with a moderate supply of water and a day temperature of from 65° to 70° with nights 60°.

SALTER BROS.

Rochester, N. Y.

Roses in Solid Beds.

The best Mermets that come into the Chicago market are grown by George Klehm at Arlington Heights, and they are grown in solid beds, in fact many of his methods vary considerably from those of most other successful growers. In the center bed of one of his houses are a lot of Mermets, now four years old, from which he is cutting great quantities of magnificent blooms of great substance

and beautiful color. On the surface of this solid bed is a heavy mulch of cow manure, but he rarely syringes and the bed has not been watered since started last October. He thinks that syringing is apt to injure the flowers. They are grown cool and no red spider was present. There are traces of mildew and the foliage frequently has a rather rough appearance, but the blooms are there, lots of them, and of unexcelled quality. The soil is rather heavy but not stiff. The blooms have so much substance that they last in good condition a remarkably long time after being cut.

Albany and Hoste.

Duchess of Albany I regard as one of the best roses introduced for several years, and it must become a general favorite in the very near future. It requires the same treatment as La France, from which it is very distinct in color.

Mme. Hoste is also a real acquisition. When first introduced the general opinion was that it was not decided enough in color to make it popular, but at this writing it is very popular in the New York market and is steadily growing in favor. It is a good grower and very free

flowering. At its best it is a clear canary yellow of good size and shape, and is a good companion for Bride, Bennett, Mermet, etc. in a general way.

J. N. MAY.

Albany and Hoste.

Duchess of Albany is a superb rose, equal to La France in size, form and freedom of bloom and the color is much deeper. It must prove a general favorite.

Mme. Hoste is quite an acquisition. It is larger than Perle, of faultless form, the color is pleasing, the stems are strong and erect. It is the most profitable rose we have this year.

ROBT. CRAIG.

Philadelphia, Jan. 7.

THE METEOR.—L. L. May & Co., St. Paul, send us a few blooms of Meteor, which are admirably colored and of fair size. They say: "This has thus far proved one of the most profitable roses in our houses. It is not a cropper, sells itself, brings fancy prices and has proved with us to be of good habit and clean."

Gladiolus Snow White.

This variety which is soon to become so well known in the horticultural world through the very general announcement made in the 1890 catalogues, is without doubt one of the most valuable of its class ever sent out. While it has been shown at the meetings of the Massachusetts Hort. Society in former years, it was never brought to the attention of the trade so prominently as at the annual convention of the Society of American Florists in New York, August 1888; it there attracted universal attention and admiration; at that time more than a year still remained before the bulbs were to be offered to the trade. We understand that the bulb is not a difficult one to grow and increases quite rapidly. Herein lies much of its great value to the trade, for once thoroughly disseminated it will no doubt be largely propagated by many and the stock soon become as common, as it must be exceedingly useful. Messrs. Hallock & Son may well be credited with the introduction of a novelty of great value. It seems a matter of regret that the retail trade of America this season differ so widely in price of this specialty. We note a variation of 100 per cent in the price per dozen in different catalogues; certainly an unfortunate condition of affairs for those who have quoted them at the highest rates.

VAN LEEUWEN'S MIGNONETTE.—MR. A. Van Leeuwen, of Garfield, N. J., sends us a photograph of a mignonette which he has raised. He writes, "The color is pure white and the fragrance very strong. The peculiarity of the flower is that instead of forming the female part it would get a new cluster of the male part out of which the flower would continue branching into new clusters." And as it failed to ripen any seed he has had to perpetuate it from cuttings. He asks our opinion regarding its probable commercial value, also the advisability of naming it "Reseda monstrosa odorata." Any mignonette that has to be propagated continuously from cuttings can hardly appeal successfully to the general cultivator. Van Leeuwen's Mignonette would be a better name.

WHOLESALE GIVERS always refer to the advertising pages of THE FLORIST when they wish to purchase. Have your trade list there so that you may receive your share of the trade.

The Carnation Belt.

A recent trip through what is generally recognized as the carnation belt of Pennsylvania revealed some interesting and important features of that branch of horticultural industry. Theso-called belt is embraced in a circle of about ten miles in diameter, of which Kennett may be regarded as the center, with Avondale on one side and Unionville on the other taking opposite outside positions. Of course I do not pretend to be exact in the location of the points named, or their distances apart, but they are sufficiently so for the purposes of this sketch. And they are also sufficiently accurate to explode the belt theory as a myth, for I am thoroughly satisfied that there is nothing in the atmosphere of that particular section to exert a favorable influence over the carnation any more than in a thousand other similar sections in that and adjoining counties in Pennsylvania and other states; neither is there anything peculiar about the soil so far as I am able to detect, in that particular it is very similar in appearance to that surrounding Philadelphia and other parts of the state, with which I was familiar many years ago—a rather light calcareous soil containing a slight admixture of micaceous matter, being the predominant features of a large portion of that section of the state. With the above facts in view I have no hesitation in declaring the carnation belt a misnomer.

"But," say the readers of the *FLORIST*, "you must admit that the carnation is quite largely and successfully grown in that section, pray how do you account for that?" Well, I account for the successful carnation culture in that particular section in this way: The industry is in the hands of young, energetic and persevering men, who take a pride in and devote their whole time and energies to their business. This is the grand secret, the same as in every other profession, calling, or walk in life. When men are determined to excel in any particular calling their efforts are generally crowned with success.

Mr. Charles T. Starr, of Avondale, is the veteran pioneer of the business in that section, and though still comparatively a young man, Mr. Starr has met with great success in carnation culture. This is the home of some very fine sorts, notably Century, Dawn, and also the carnation of all carnations, Buttercup, as well as numerous others long since familiar to the trade. Mr. Starr has also some very promising seedlings which we shall probably hear from in the near future, among which may be named Golden Gate, a deep, rich, bright yellow, a very promising variety, also Christmas, now being distributed as a rival to Grace Wilder. Mr. Starr's place is a veritable beauty spot situated about one mile from Avondale station, in the midst of a magnificent rolling country, and in spring and summer must be a perfect paradise.

Mr. Wm. Swayne, whose place is in the town of Kennett, is a young man full of vim and perseverance who has already met with marked success as a cultivator in this line. His specialties are the new white sorts Lamborn and Wm. Swayne,

which have attained great popularity as improvements over older sorts, and the dark crimson variety, Pride of Kennett, which besides its color has a rich perfume to recommend it.

Mr. Edward Swayne, another cultivator of the carnation, is also a resident of the same town. Mr. Joseph Renard occupies the place long ago established at Unionville by Thos. F. Seal, four and a half miles away from Kennett. Mr. Shelmire, another ambitious grower, is in the town of Avondale, while Mr. Chambers, whose place is between Avondale and Kennett, as well as being a successful grower is the inventor of an ingenious contrivance for ventilating greenhouses, which we shall doubtless hear of in the future. Avondale and Kennett are both situated on the Baltimore Central railroad, and Avondale being the farthest is about thirty-eight miles from Philadelphia.

H. E. CHITTY.

Paterson, N. J., Jan. 17.

Don't Believe it is the Twitter.

In reply to Mr. Chitty's article in January 15 issue of the *AM. FLORIST* on the cause of the shoots of my carnations twisting or curling as you may call it, I did not state my idea as to the cause. I thought I would wait and see what others would say about it. I have made a pretty thorough examination of them and I don't think the carnation twitter has anything to do with it.

As stated before my plants are grown in solid beds, the sub-soil of which is a heavy clay, which keeps the soil so wet that they can not be watered at all. There are other varieties in the same house side by side with the Garfield which are not affected. I believe the cause is cold wet feet. I believe if the beds were raised up so as to give drainage that the affliction would be a matter of second thought.

Mr. Chitty speaks of green manures as having more to do with it than anything else. I would say that the manure used was well rotted cow manure and ground bone.

G. LESTER HOLLS.

Seedling Carnations.

Mr. E. B. Jennings, Southport, Conn., sends us specimen blooms of five seedling carnations from seed of his own growing.

Snow Bird, a large white bloom is a grand flower with good stems and solid calyx, and strongly fragrant—the fragrance being very strong even after the long shipment by mail, and the flowers arrived in excellent condition. We are very favorably impressed with the flowers of this variety sent us.

None of the other flowers sent show any improvement over existing sorts.

Carnation Bertha Soper.

A box of blooms and a specimen plant of this carnation from Mr. J. J. Soper, Rockford, Ill., the introducer, were worthy of all praise. The color is a very taking shade of salmon pink, flowers of good size, uniformly sound calyx and on fine long stems. The plant seen was a splendid specimen of vigorous, sturdy growth, and well covered with bloom, and Mr. Soper states that it has been a most profitable thing with him.

He believes it to be a seedling, but can not positively say as to this. Some four years ago he was presented with a few cuttings by a lady who had it as house plant, and he grew his stock from these

cuttings. After its value was noted he made inquiries as to where the lady obtained the plant and was informed that it had been grown in her neighborhood for many years, so long that it could not be remembered who had it first. None of the florists to whom it has been shown could name it. We are inclined to the belief, however, that it is some good old sort, in which merit as a forcing variety had not been before noted, but as nobody else seems to have it, and its name—if it had one—has been lost to us, probably Mr. Soper is warranted in giving it a name.

Best Six Carnations for Beginner.

W. C. in the January 1 issue of the *FLORIST* asks some one to name the best six cut flower carnations for a beginner. That is a difficult question to answer, for as we all know different varieties vary in the different localities and under the different treatment they receive from various growers.

I would suggest that W. C. try at least one dozen varieties and after a thorough trial he will know better than any one can tell him which will do best in his peculiar locality and under the treatment he is able to give them.

Our experience in flowering over ninety varieties this year and the reports that reach us from different sections of the country show the following varieties to be giving general satisfaction.

L. L. Lamborn, dwarf habit, producing very large pure white blossoms and very early.

Silver Spray, also early, white and after the first few pickings producing almost exclusively long stemmed blooms.

Hinze's White, though one of the older varieties, is still to the front and the creamy color the blooms sometimes take on is no detriment.

Snowball is the counterpart of Hinze's White, except that it is a pure white.

Grace Wilder, a favorite pink shade and where it succeeds well the best of its color, and though not so generally successful is much sought for and worthy of a trial.

Beauty of Oxford, the color of Grace Wilder at its best, and we think will rival that variety.

Tidal Wave, the rich glowing pink introduced last year, is very fragrant, strong and productive.

For scarlet, Florence and E. G. Hill will give different shades, both perfect in their kind, vigorous habit, very productive and early bloomers.

For light canary or cream, Starlight and for deep, clear yellow, Jaquire, both new and giving good satisfaction.

In deep crimson, Pride of Kennett is dwarf, early and productive.

Emperor of Morocco is equally early and productive, but taller and having many long stemmed blossoms.

We have named only varieties giving solid colors, as they are generally preferred for florists' use.

JAS. G. HANCOCK.

Grand Haven, Mich., Jan. 8.

Propagating from Plants which have been Diseased.

Mr. John Curwen, Jr., of Villa Nova, Pa., presents for our consideration a somewhat serious question on the advisability of propagating from diseased carnations. This is a subject not at all pleasant to contemplate, as the bare thought that disease may become prevalent with this important plant is at once dismal and discouraging. But as far as

my observation goes, where plants have grown away from the disease and are presenting the appearance of perfect health, I can see no reason why cuttings may not be taken without risk of perpetuating the trouble. Violets are so propagated and the disease now showing itself among carnations seems analogous to the violet disease, and if it should ultimately so prove, I have no doubt that the methods they have devised to obviate the difficulty the same as in case of the violets, which are as abundant on the market as ever, and successful growers only realize about the same price for their product as when there was no disease. I am inclined to take a hopeful view of the matter, and would advise Mr. Curven to propagate from his carnations, especially as they appear from his description of having grown away from the disease, and now so far as the new growth is concerned are perfectly healthy. Our experience of the coming season will probably increase our knowledge of this subject. CHITTY.

Cut Worms Among Carnations.

Mr. H. Tong, of Erie, Pa., writes an interesting letter descriptive of the depredations of his cut worms of which he also sends samples. Mr. Tong may rest assured that they are the simon pure article, and identical with the New Jersey form of that pest, which is the dread of farmers and truck growers in this and adjoining counties. With the exception however that here they generally content themselves with cutting off such plants as cabbage, tomato, cauliflower, lettuce, beans, etc. at or near the ground surface. As remedies would ashes, slug shot and lime are used with more or less effect. But in Mr. Tong's case where they appear to climb into his carnation plants for the purpose of attacking the flowers I would suggest that he use every effort to catch them by hand and destroy them. An occasional dressing of either of the above mentioned remedies may also help make the feeding process distasteful to them; the same may be also effective if mixed with the soil. The baking process mentioned by Mr. Tong would doubtless result in destroying all traces of insect life, but the same process would also result in destroying the vegetable fibre of the soil, which most of us regard as an important factor in carnation culture. CHITTY.

CARNATION LIZZIE MCGOWAN.—Mr. John McGowan, the introducer of this carnation, has decided not to send it out for another year.

Banquet at New York.

The third annual dinner of the New York Florist Club was given at Morillo's January 19. The death of Peter Henderson was a sad damper on the festivities, which would have been postponed but that arrangements had been carried so far as to render this impossible. Mr. Andrew Cowan opened with some touching words in eulogy of his departed friend whose memory was then drunk, standing and in silence.

President J. H. Taylor sat at the head of the table and presided with his usual grace, while W. S. Allen as master of ceremonies skirmished around so industriously as to quite forget the wants of his own inner man.

Several members of the executive committee S. A. F. were present as guests of the club, and all testified to their hearty appreciation of the generous hospitality of their reception and their admiration of

the great beauty of the decorations. Hereas at Boston the table was loaded with fine flowers, contributed and arranged by members of the club who had spared neither time nor money to honor the occasion with an adequate display of their art.

People have been heard to scoff at the idea that intimate companionship with flowers has necessarily a refining and elevating influence and it might well be supposed that men who have been handling flowers all day and every day as simple merchandise or raw material should lose the faculty of regarding them from any other standpoint. Yet in fact we nowhere see more lavish and tasteful floral displays than at florists' social gatherings and certainly do these displays meet nowhere with more enthusiastic and discriminating admiration.

These annual banquets must do much to foster and cement good fellowship among members of the club, and it is a feature worthy of imitation by every florist club in the land. R.

WE WILL circulate your spring trade list to every wholesale buyer in America for less than the postage alone would cost you.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED.—As florist and gardener, by a competent man. Address G. ARDREY, Foughkeepsie, N. Y.

SITUATION WANTED.—Married man wishes for S. response in position; good grower of cut flowers, ferns, palms and general florist stock. Address C. L., care American Florist, Chicago.

SITUATION WANTED.—By a practical commercial S. gardener, German, single, who understands his business thoroughly. At Liberty 1st of Feb. or 1st of March. Address C. F. Box 319, Summit, N. J.

SITUATION WANTED.—By married man with no S. family, as a gardener, thoroughly versed in rose, cut flowers and bedding plants. References first-class. R. E. WAJNECUTH, box 6, Germantown, Ill.

SITUATION WANTED.—By a German gardener, S. and florist 5 years' experience in all branches; age 24. Best references. A place near Chicago preferred. Address ANDREW DOTTERWEICH, Durskirk, N. Y.

SITUATION WANTED.—By a sober and industrious S. and florist and gardener, between 30 and 40 years of age, month of May if possible—in the South. Best of references given. Address ANDREW SMITH, 225 Camp Street, New Orleans, La.

SITUATION WANTED.—By thoroughly experienced gardener and florist; single; age 25; German; in commercial or private place, for February 15 or March 1. Good reference. Address E. K., care American Florist, Chicago.

SITUATION WANTED.—By a first-class, experienced S. and florist, grower and packer of cut flowers, forcing bulbs, and a plantman of 12 years' experience; single man; reference. Address F. LORIST 23, care American Florist, Chicago.

SITUATION WANTED.—As foreman, private of S. commercial place, good rose grower and general greenhouse work; also understands landscape gardening. Can give best of reference. Address GARDNER, 1456 Marston St. Philadelphia, Pa.

SITUATION WANTED.—As florist and gardener on commercial or private place; has been 5 years in this country. Experience in propagation, growing of roses and plants in general. Please address L. KNAPP, Florist, Agr. College, Lansing, Mich.

SITUATION WANTED.—By an Englishman, as S. gardener and florist, thoroughly understands growing of rose and all kinds of cut flowers and plants; 20 years' experience; 11 years in last situation. Apply to EXETER MACHINE WORKS, Exeter, N. H.

SITUATION WANTED.—As foreman or assistant, S. in commercial or private place. Long experience in the leading nurseries of Germany, England, Belgium and the States. Best of references given as to ability and character. Would like to go to the Western States. Address CHARLES S., care Mr. Schweitzer, 34 E. 89th St., New York.

WANTED.—Florists and nurserymen's catalogues. Address AXEL C. ANDERSON, 103 3rd St., West, Duluth, Minn.

WANTED.—Practical young men accustomed to handle large quantities of general stock correctly and with lightning rapidity. Highest wages incessably indispensable. Address H. W. BUCKNER, Rockford, Ill.

WANTED.—Landscape and vegetable gardener; strong, intelligent, sober and energetic man. Address E. T. NOBLE, Nashville, Tenn.

WANTED.—A first-class florist to take charge of my two sets of greenhouses—three courses in Chippewa Falls and two in Neelakee—cities of 15,000 and 35,000 population. To a good, sober man I will give good wages, or an interest in the business. Address B. F. MILLARD, Chippewa Falls, Wis.

WANTED.—Unrooted cuttings of the following: 1200 double Geraniums in 12 kinds; 100 Rose Marie Lambert; 100 Geo. Jacquemont; 200 Dismore; 200 Meteor; 200 Sunset; 200 Perle des Bains; 200 Ivy Geraniums; 200 Abutilon Ellipse; 100 Chrysanthemum Mrs. Alpha; 100 Mrs. H. C. and C. G. Carles; 100 Aza Spaulding; 600 double Petunias in 12 kinds; 1200 Mumoth Verbena in 12 kinds. State price of each kind, rooted and unrooted; clean and healthy stock. Will take from one or more parties. Address P. J. S., care American Florist.

FOR SALE.—A \$5,000 business on easy terms. For particulars, address X, care American Florist.

FOR SALE.—One of the finest retail stores in the city of Chicago. Established 8 years. Excellent location, doing a fine business. Owner will leave the city. A high order of property for one who secure an established business at a reasonable price. Address J. L., care American Florist, Chicago.

FOR SALE.—Established 10 years. Seed store and 10 greenhouses (10,000 feet glass); heated by two boilers with steam. Large stock of plants. 5 houses devoted to rose culture, cutting the crop. Located in town of 350 inhabitants. Terms very easy—one-half of purchase money may remain. Satisfactory reasons for selling. Address LOCK BOX 25, Newtown P. O., Bucks Co., Pa.

FOR SALE OR RENT.—Florist establishment, 10,000 feet of glass, new houses; 100 miles from Philadelphia; 50,000 population; houses well stocked; cheap fuel. This is regarded by well known men in the trade as an exceptional opportunity for a man who understands the business. Every advantage given the right man. Other business demands immediate action. Address STRAUCH BROS., Pottsville, Pa.

FOR SALE.—In the city of Richmond, Va., adjoining the largest cemetery, four greenhouses, heated by steam, and stocked with winter flowering and spring bedding plants, for sale or rent on a lease of ground leased from the Cemetery Co., whose patronage goes to the benefit of the owner. Will be had by appointment Sept. of Cemetery. Will be cheap and use his influence for the purchaser. Address HOLLY, Carrier 7, Richmond, Va.

FOR SALE.—A well appointed wholesale florist establishment, consisting of 10,000 square ft. of ground, covered with glass, in the city of New York City. All cut flowers are sold on the premises to first-class retailers, and the demand is excellent supply. Excellent reasons given for selling. Price, \$20,000, one-third cash, balance on bond and mortgage. For particulars, address THOS. W. WEATHERED'S SONS, 46 and 48 Marion Street, New York City.

FOR SALE.—The leading florists business in Topeka, Kan., the Capital and largest city of the State. Demand for flowers is constantly increasing. Population doubled in the last five years. People cultured, and one of the finest cities in the West. Large shipping facilities. Best of references given. Best known florists business in the State. Business flourishing, and can be indefinitely developed by cash and energy. Best of references given. Will be had at a bargain for cash. Correspondence solicited. Address PAUL M. PIERSON & Co., Topeka, Kansas.

FOR SALE.

Several thousand Ficus elastica cuttings; also several very large Ficus trees, 12 to 15 feet high, with from 100 to 300 young trees. Address JOHN MILLER, Box K, Glenville, O.

FOR SALE.

At Farwood, near Plainfield, N. J., on main line of N. Y. Central & H. R. R., a fine establishment consisting of about 5000 square feet of glass, heated by hot water apparatus; well stocked, and kept by men with about 13 acres of ground. Will sell cheap. For particulars address M. SCHMIDT, Farwood, N. J.

WANTED TO LEASE.

About 5000 feet of glass suitable for growing Roses, within one hour and a half from New York. Address M. J. BARRY, P. O. Box 384, NYACK, NEW YORK.

YOUNGSTOWN, OHIO.

Patentee of the best Ventilating Machinery.

CALIFORNIA'S NEW ROSE "RAINBOW."

The "RAINBOW" is *The coming Out Flower Rose*, it is not only handsome, but I do state that it will also be one of the paying roses, ranking with *La France* and *Perle des Jardins*.

MY REASONS FOR IT:

FIRST: Its freedom of bloom surpassing Papa Gontier, from which it is a sport, having the same erect habit of growth.

SECOND: Color of the flowers. Imagine a Papa Gontier of a lovely pink, blotched and streaked with the darkest Gontier color, at the same time only enough to add to its beauty, with base of petals of a rich amber.

THIRD: Have you any pink rose that is as free a grower, as free from disease, does as well as Gontier in a low temperature and produces its flowers on strong and erect stems?

The "RAINBOW" answers the above description, and has been recognized by the highest award at the recent Fall Exhibition of the California State Floral Society.

The judges in a Special Report to the Society stated as follows:

"We, the undersigned, your COMMITTEE ON AWARDS of Prizes for the Fall Exhibition of the California State Floral Society, have carefully examined the new rose "RAINBOW" brought out by John H. Sievers of San Francisco, Cal., and exhibited by him, and we find that this new rose is possessed of unusual merit as to color, form, substance, and its variegation—the latter being very distinct—and award to Mr. Sievers, for the same, the highest premium of the Society—a Silver Cup."

Signed,

JOHN GABLER,	B. M. PRATT,
WM. GAUGE,	CARL KRUGER,
CHS. SCHUMANN,	

The "RAINBOW" originated at my nurseries in the Spring of 1888, and will shortly be offered to the Trade.

Visitors from the East should not fail to call and see for themselves.

Any enquiries and communications in regard to the "RAINBOW" should be directed to my address.

JOHN H. SIEVERS, 25 Post Street,
SAN FRANCISCO, CAL.

IMITATING NATURE.

It has been so frequently urged that we should "imitate nature" in our methods of culture, that it has practically been accepted as an axiom by many, possibly to their disadvantage, for while nature's ways should be fully considered, too close an imitation will prove disastrous in many cases. The plants we grow are not the plants which grow free in nature's garden, and the majority we must make more productive and have the product of better quality than is the case where only natural conditions govern. We undertake to remove by artificial means as many as possible of the unfavorable influences which affect the plant in nature and at the same time add to and strengthen those which are plainly beneficial. In doing this we are apt to go to extremes which result in conditions that prove detrimental, but excesses in one direction should not be followed by equally unwise excesses in another. Because we have overdone is no reason that we should starve.

The writer of an excellent article in the *Gardeners' Chronicle* of January 4, under the title of "A gardener's problem," recalls a principle long ago pointed out by Beau Herbert: "Plants," he says, "in many cases are peculiar to those soils which are not best for them, but where they can exist. Why do plants," he further asks, "which are found only in particular situations, improve under cultivation, and (as I believe to be the case) more so than those which are generally dispersed? and consequently, is the soil or subsoil on which alone certain plants are found in a wild state, necessary to them, or, at least, always best for them. I think the answer must be 'No,' to the latter question; and to the former question, 'Because their most dangerous rivals, which, in a wild state, would overpower them in richer soil are removed.'"

WHOLESALE CUT FLOWER PRICES.—We have received from a Philadelphia grower a lengthy communication complaining of the great variation between the wholesale prices we quote and the returns made by the commission dealer to whom he consigns his roses. Many of the points he asks information upon have been fully covered in these columns, which shows that he has not been a very close reader of the *FLORIST* in the past. However, if the facts are as stated in several cases described in his communication there can be little doubt that he has been dishonestly dealt with, and we should advise him to try another commission dealer. And if he can prove that less money has been returned than the amount received, less the usual commission, we urge upon him the necessity of bringing suit to recover, not so much for the sake of the

amount but as a matter of principle. For if there are dishonest commission dealers, the one who shall expose them will benefit the whole trade. The *FLORIST* stands ready to publish to the trade any one convicted of dishonest practices. Where quality of stock consigned to commission dealers is good, and demand is known to be brisk, there should be but little difference between the wholesale prices we quote—less the commission—and the rate of returns made to growers, but at other times the variation may be wide and still be legitimate, especially with the system which prevails among some commission men of reporting everything as sold when only a portion has really been disposed of, and the rate averaged for the entire lot. For instance, a dealer receives 500 roses of which he sells 300 at \$5 a hundred, while the remaining 200 are lost, and he reports sales of 500 roses at \$3 a hundred, total \$15, less commission. It amounts to the same thing, but does not give the true state of affairs. Again when the market is heavily loaded dealers do frequently make specially low prices for large lots in order to move them, and such cuts are not taken into consideration in our quotations.

WE HAVE RECEIVED a copy of the proceedings of the third annual convention of the Association of American Cemetery Superintendents held at Detroit last September, from Secretary A. H. Sargent, Akron, O. It contains 110 pages of essays on subjects of special interest to any one connected with a cemetery, with full discussions on same. An essay on "The ideal cemetery superintendent," by F. Higgins, "Woodmere," Detroit, presents a great many cold facts in a witty and interesting way. The successful florist must be competent to do almost anything, but the qualifications for an ideal cemetery superintendent place him considerably in the lead. Here are some named in the essay mentioned: "He must above all things be, first, a gentleman; second, a prevaricator of marked ability; third, a mule driver from way back, and fourth, a civil engineer and an artist. He must be a scientific farmer, thoroughly familiar with soils, drainage, grasses, fertilizers, etc. He must have a good general knowledge of flowers, and as to trees and shrubs, why he must know all about them. He must be a practical road builder and a stone mason of ability. He is asked at times to furnish estimates for the building and equipping of a street railway track, or the cost of a complete system of water works; and I have no doubt if he was asked to bridge the Atlantic Ocean he would make the attempt and quite likely succeed."

THE AGRICULTURAL grasses and forage plants of the United States and such foreign kinds as have been introduced, by Dr. Geo. Vasey, botanist; with an appendix on the chemical composition of grasses, by Clifford Richardson, and a glossary of terms used in describing grasses. A new, revised and enlarged edition with 114 plates. Published by authority of the Secretary of Agriculture, has been received from Secretary of Agriculture, J. M. Rusk, Washington, D. C. The title sufficiently explains the scope of the work which contains 148 pages of letter press in addition to the 114 plates. To the student of grasses and forage plants it can not fail to be of very great value.

A WHOLE PAGE in the *FLORIST* will cost you only \$42 for one issue and in it you can send your spring trade list to every wholesale buyer in the United States and Canada. We can do you more good for

less money than a list printed and mailed by you. If your list will go in a space of one half page, it will cost you but \$21. We will print any number of extra impressions desired from the type after being set, at slight cost.

A SMALL trade list will go in space of one half page and cost you only \$21. Or in one column costing but \$14. This includes printing, addressing, postage and mailing to over 5,000 live buyers. Order space now.

Catalogues Received.

James Vick, seedsman, Rochester, N. Y., seeds and plants; W. C. Beckert, Allegheny, Pa., seeds; Park Nursery Co., Pasadena, Cal., plants; California Nursery Co., Niles, Cal., nursery stock; T. W. Toole, Baraboo, Wis., pansies; R. & J. Farquhar & Co., Boston, seeds; V. H. Hallock & Son, Queens, N. Y., seasonal seeds for florists; Cole & Bro., Pella, Ia., seeds; T. H. Spaulding, Orange, N. J., chrysanthemums; Dingee & Conard Co., West Grove, Pa., roses, hardy plants, bulbs and seeds; Haage & Schmidt, Erfurt, Germany, seeds; same, plants; J. M. Howell, Dallas, Texas, seeds, plants and nursery stock; L. L. May & Co., St. Paul, plants and seeds; Luther Burbank, Santa Rosa, Cal., horticultural novelties; J. Seubinger, Oakland, Cal., seeds and plants.

Boston Notes.

Richard Oldrieve, florist, of Newton, died on December 28. He was one of the oldest established florists in Newton.

John Heron, well known in the florist business in Chelsea for the past 30 years, died on January 18, aged 66.

Heath has appeared in the flower stores in small quantities.

Ulrich Brunner has been a great favorite here this season among rose buyers.

Carnations never were so scarce as at present. This is true of all colors, but especially of white, and the prices hold at the highest mark.

One cause of the scarcity of white carnations, and of all white flowers generally, is doubtless the unhealthy season, and consequent demand for funeral flowers. This particular branch of the florist trade is unprecedentedly brisk.

Once upon a time, it is said, some one interrupted a church service with the announcement that John Smith's house was afire, and instantly nearly one half of the congregation ran out in great alarm. A similar result seems to have followed the reference in these notes two weeks ago to a stolen budding knife. "Did you mean anything personal about me?" How would it do to hang the budding knives to an electric light wire when not in use?

Geo. W. Loring and Henry Cartwright have formed a co-partnership under the style of Loring & Co., and will engage in the florist business in the store under the Tremont House, formerly occupied by Bunker & Co.

The Seed Trade.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. McCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1890.

IT COMES HIGH.

The death of Mr. Henderson suggests again the old inquiry and adds an argument to the position we have long held; it is, that as trade is now conducted in this and perhaps other countries, the business man can be the business man only. In the struggle for supremacy now made there is neither time for recreation nor rest, none for art, science or current literature; hardly for the most commensal affairs. Mr. Henderson was pre-eminently a business man. Even with his books and contributions to the horticultural press, every line he wrote meant to him dollars and cents. Every day of his life and nearly every hour had its allotted labor, arranged for most economical devotion to business. Few were his seasons of leisure and few his opportunities for enjoyment, independent of his work, of his well-won fortune. With the competition of the present day he could not hold his own otherwise. He could not spare six months and scarcely sixty days without injurious results to his establishment. The daily grind of the great machine must be watched, its hopper must be fed and even Mr. Henderson was not and could not be above it.

Look at the record of that business house; Mr. James Reid, son-in-law and partner of Mr. Henderson, and for 10 years the managing brain of the seed department, which he almost created, was buried in 1887, at the age of 36. Mr. John Skinner, for five years superintendent and for 13 years connected with the house, was buried in 1885, at the age of 38. Mr. Alfred Henderson, still under 40 years, is quite broken down in health. Does not this show what it costs to stand at the top? We do not mention these facts as applicable to this firm alone. It is practically true of the largest firms in this active trade the country over. Is the game worth the candle? And must we die to live?

It is suspected that all of the onion seed sold this season will not be of 1889 crop.

HENRY A. SALZER who has been under an oculist's care for some weeks is now much improved.

BECHTERT's Chartier Radish becomes "American Knickerbocker" when seen in an English catalogue.

VISITED CHICAGO: Geo. S. Haskell, Chas. P. Brastan, Mr. Emerson, and others on January 27.

THE FIRM of Howard & Underhill seems to have dissolved. Mr. James H. Howard is out with business circulars on his own account.

L. L. MAY & Co.'s 104 page catalogue of "Northern Growth" seeds shows by its bright cover, rare plant and seed novelties, that a new "Northern light" blazes forth with more than usual brilliancy.

MR. HENRY VILMORIN, of the Paris seed house of Vilmorin, Andrieux & Co., has recently been decorated as officer of the Legion of Honor, and celebrated the occasion by a banquet at which 410 of the employees of the firm were present.

Nitrate of Soda.

In reply to W. S., on page 262 of the FLORIST of the 15th inst., I would say that I have used nitrate of soda on roses, carnations, chrysanthemums and all plants that I have, and found that it caused a quick and strong growth.

I used three tablespoonsful in a 10-quart watering can. It is better to put the nitrate of soda in the can first and pour the water on it. I used it once a week.

Germantown, Pa. J. A. B.

News Notes.

CINCINNATI.—Mr. Frank Huntsman has made an assignment.

ORDER NOW space in the AMERICAN FLORIST for your spring trade list.

CLEVELAND.—Holiday trade about 10 per cent larger than last year, and prices higher, supply short.

HAMILTON, ONT.—Holiday trade larger than last year with increased demand for decorative plants. Prices rather better than last year, supply short, quality very fair considering dull weather.

DENVER, COLO.—Holiday trade nearly double that of last year with marked increased demand for roses and chrysanthemums. Prices about same as last year, supply not quite equal to demand.

SAN FRANCISCO.—Holiday trade smaller than last year and prices lower, the supply exceeded demand. Quality of flowers was not equal to last year. Trade in Christmas greens was poor. Good prices would have been paid for chrysanthemums if they had not been spoiled by rain.

INDIANAPOLIS.—Charles Riman, in the florist business here for the last twenty-two years, died January 24, aged 56 years. He leaves a widow and several grown children. Mr. Riman was a member of the Society of American Florists, of the Society of Indiana Florists and of the local Florists' Club.

NEW YORK.—The fourth annual orchid show, given by Siebrecht & Wadley will open February 18 and will continue ten days. It is announced that space will be reserved for any one desiring to exhibit any new plant or flower of special merit, including orchids, and that all exhibitors will receive proper credit in the press.

COLUMBIA, Mo.—The U. S. Experiment Station at this point was seriously damaged by a cyclone which swept through the southeast part of the city January 13. The main building was unroofed and the greenhouses were almost entirely demolished. The loss is about \$2,000. The work of rebuilding will begin at once.

BUFFALO.—The Buffalo Florists' Club will give a spring show during the week beginning Monday March 24 next. A preliminary list of premium classes has been published, copies of which may be obtained from Danl B. Long, secretary, 457 Main Street, Buffalo, who will also supply any further information desired.

CINCINNATI.—The Florists' Society held their annual meeting and election on January 10. The following officers were elected for the ensuing year: President, C. L. Mitchell; 1st Vice-President, Albert McCullough; 2nd Vice-President, George Corbett; Secretary, W. C. Nolan; Treasurer, R. Witterstaetter; Executive Committee, B. P. Critchell, R. J. Murphy and H. L. Sunderbruch. The society then decided to give another chrysanthemum exhibition next November.

J. C. VAUGHAN,
CHICAGO.

SYNDICATE OF GROWERS

—) OF (—

FLOWERING BULBS, OLLIOULES, VAR, FRANCE.

We have the honor to inform the Seedsmen that from this year on the Syndicate will export its own products.

Heretofore, the bulbs have been sold to local merchants who have by common consent taken enormous profits, etc., in consequence of which advance in prices Foreign houses have decreased their orders.

As in future the growers can deal direct, Seedsmen will be able to purchase WHITE ROMAN HYACINTHS at exceedingly LOW PRICES.

Liberal Patrons.

It is very consoling to read of some eastern florists' experience with some of their "liberal" patrons. The following will give them a sample of western experience in the same direction. Scarcely a week passes that we do not have something in this line.

On Christmas eve the daughter of one of our wealthiest citizens called to get one half dozen white rose buds for 25 cents, as she was to be married the next morning. About the same time we received an order from a distance sent by a gentleman for 50 cents worth of rose buds, snailax and carnations. But best of all was a lady coming ten miles for a 5 cent plant, and when told that 10 cents was the least that we sold that kind of plant for, her reply was, I will go home without anything, before I will pay such an exorbitant price. S. H. B.

Abilene, Kan.

SAVE MONEY and secure better results from your spring trade list by printing it in the AMERICAN FLORIST.

CYCAS REVOLUTA,

In all sizes from 8 inches to 3 ft. high, laid down in San Francisco, freight and all other charges paid.

Pot grown, well established plants, with root balls (root balls excluded), per 100 lbs. U. S. currency, \$18.00.

Open ground, well rooted, out of my Yokohama nurseries, per 100 lbs., U. S. currency, \$15.00.

Freshly collected, prime quality, per 100 lbs. U. S. currency, \$12.00.

[Orders for less than 500 pounds cannot be executed, as orders for a few hundred pounds would cost too much freight in proportion.]

RHAPIS FLABELLIFORMIS.

Also laid down in San Francisco.

Trees & Plants

Of all kinds at almost half price. Lovett's Guide gives descriptions and prices, tells how to purchase, plant, prune, etc. It is a book of over 60 pages, finely illustrated, free; with colored plates 10c.

Trees & Plants by Mail a Specialty.

A copy of that practical, horticultural journal, ORCHARD & GARDEN, free to all who state where they saw this advt.

J. T. Lovett Co.,

LITTLE SILVER, N. J.

NO TALLY HO! NO HORNS!!

But if you are after Common Sense and Cold

Facts, we are with you every time.

It will pay you to look over our New Catalogue. There are things in it you want. We handle all kinds of Seeds and Bulbs used by florists. Competent judges claim our choice strains superior to all others on the market. Have you tried them? If not, we are willing to convince you. Give us a chance. Catalogues for the asking.

Anything new this season? Make a note of the following, you will hear more anon about some of them:—

- | | | | |
|--|------|---|------|
| 1 AQUILEGA STUARTI, Dr. Stuart's grand new | pkt. | 7 DIANTHUS HEDDEWIGI, "The Bride," pure | pkt. |
| Columbian..... | 25 | white with a velvety purple centre..... | 10 |
| 2 PYRETHRUM ULIGINOSUM, single white. A | 25 | 8 NEW ENGLISH PRIMROSES, a select strain..... | 25 |
| gem for cutting..... | 15 | 9 SHIRLEY POPPIES, var. colors; distinct hue..... | 10 |
| 3 MYOSOTIS ELEGANTISSIMA, quite distinct, | 25 | 10 HENDERSON'S PETUNIAS, single, superb in size | 25 |
| and a great acquisition..... | 25 | and color..... | 25 |
| 4 ROSY MORN POPPY, unique and beautiful..... | 10 | 11 GIANT AMERICAN COWSLIP (Dodecatheon | 25 |
| 5 KALANCHOE CARNEA, a promising novelty..... | 25 | Cleveland)..... | 25 |
| 6 PRINULA OBCONICA, indispensable for cut- | 25 | 12 PEACOCK PANSY (Carter's new Pansy), | 25 |
| ting, etc..... | 25 | | 25 |

These are not all. Our Novelty List will tell you about a host of others. A good dozen. Stock very limited on some. \$1.75 if you want a packet of each of the above twelve. We advise early orders on account of the limited quantity of seed for distribution this season on several sorts.

JOHN GARDINER & CO

SEED GROWERS, IMPORTERS, and DEALERS.

PHILADELPHIA.

U. S. EXPERIMENT STATION OF AGRICULTURE
AT PURDUE UNIVERSITY,
LAFAYETTE, IND., NOV. 2, 1889.

T. S. BAILEY, ESQ., DEAR SIR:—Your note to me
in hand to regard to my opinion of your Standard
Flower Pot. I have bought of you a number of pots
last spring which gave me thorough satisfaction.
As to quality, appearance and general usefulness
they have no equal, as they possess all the require-
ments of strength, smoothness and porosity (as to
porosity, a fact which every cultivator should con-
sider, as these act partially as a drainage, which
all plants require), as to smoothness they are cer-
tainly superior to any I have been using, the Cryp-
togrammus plant spore do not adhere so readily to
smooth surfaces as to the rough ones. In that re-
spect your pots remain longer clean than others.
Again if they become unclean, they are cleaned off
in less time. Taken all things in consideration,
they are a handsome and a good article, made in a
good standard size. I highly recommend your goods
to gardeners and florists engaged in these occupa-
tions, for a number one article.

Yours, PIERRE VAN LANDEGHEME,
U. S. Experiment Station of Agriculture,
Purdue University.

quality considered. Nurserymen and Dealers will consult their own interests by getting prices on this
SUPERB STOCK before buying. *2* Special inducements to buyers in large quantities.

SMITH, POWELL & LAMB, SYRACUSE, N. Y.

Do It To-morrow.

Mr. Whittle in an article on nomenclature says "there has not been one response" to the invitation of the committee to assist in the work. A friend of the writer, a Brazilian, in speaking of his countrymen says: "They never do to-day what can be put off until to-morrow," and the American florist, Brazilian-like, never writes a letter to-day if he can postpone it until to-morrow, next week, or next year.

The writer of this article sympathizes with the committee on nomenclature for he, as secretary of the Florists' Hall Association, has had bushels of experience in that line. Among others he once wrote to Mr. Whittle himself, and that gentleman, like a true florist, never deigned to reply. Why the florists of this country are so slow to appreciate that they may benefit themselves and their fellows as well by writing an occasional response to an inquiry is a mystery. If some enterprising Yankee would invent a driblet that might on special occasions be used as a pen, perhaps the committee on nomenclature might receive a few replies from members of their craft when they ask for information.

JOHN G. ESLER.

THE READERS OF THE AMERICAN FLORIST will buy what stock they need this spring from the spring trade lists published in its columns.

CATALOGUES MADE

by a man who knows how, has the material and cuts, and can guarantee accuracy and fine finish; he has been printing for the trade for a dozen years.

TWENTY-EIGHT PAGES THIS ISSUE.

THE NEW TRADE DIRECTORY was mailed on the 4th inst. to all who had ordered copies previous to that date.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen and seedsmen of the United States and Canada, designating the special branch of the trade each one is engaged in. Price \$2.

A WHOLE PAGE in the FLORIST will cost you only \$42 for one issue and in it you can send your spring trade list to every wholesale buyer in the United States and Canada. We can do you more good for less money than list printed and mailed by you. If your list will go in a space of one half page, it will cost you but \$21.

New York Notes and Comments.

Cleopatra—no relation to Mrs. J. Brown Potter—is a pretty good name for a new rose. It is one of Shepperton origin, a tea to be seen at J. N. May's. A long flower, a little like Mermet in shape, but rounder; the color a soft flesh pink. It has not been tested yet, so its capabilities are unknown, but it is certainly a pretty flower and a good size.

Another recent rose at Summit is Ernest Metz, described as a rival to the Mermet. Shape and size is quite suggestive of that flower, but it is different in color, being a clear shell pink. The queerest thing about this rose is the disparity between flowers and leaves. The leaflets are very small, not suggestive of a tea in appearance, and it looks rather absurd to see the contrast between the large flower and tiny foliage. This rose has not yet received a thorough test, so it is impossible to speak of its merits with authority.

Mr. May speaks with warm appreciation of Mme. Hoste, like all who have tried it around New York; it has done finely with him and flower buyers like it.

Wootton has certainly proved a great disappointment, not only in the growing, but in the selling. People in New York don't care for it, and don't want to buy it. The great defect to begin with is the shortness of petals—the color is all right, but it is flimsy and does not keep well. It is certainly hard to judge properly of a new rose; we always expect too many virtues to begin with, and then there is always the liability of defective treatment during the first season or two. But it is a pity to boom a new rose merely because it is pretty, when there are so many already which have prettiness and other virtues too. A new flower now must really "fill a long felt want," or it will pass into innocuous desuetude, to keep company with Her Majesty, Puritan and many another which were undoubtedly valuable under some conditions, but not for present circumstances in the trade.

Mr. May has a very richly colored form of Bennett, which may prove a distinct variation from the original form, just as the Duchess of Albany varies from La France. It is a very deep crimson, extremely velvety, suggestive in color and texture of Alfred de Rougemont or Prince Camille de Rohan. There is no reason why it should not prove a permanent variation, and a very handsome one.

A bed of Capucine seen at the same place was remarkable for its stiff, vigorous growth and long stems. It was well staked up, instead of being allowed to straggle in the drooping fashion usually seen, and this may have had a good deal to do with the upright tendency of the growth. It is a rose appreciated by many for its bright coppery color, but the bud is not large enough to suit the general taste, which runs in the direction of big flowers.

Julius Rochrs has been sending in his usual fine hybrids this winter; around the holidays these first class flowers brought \$1.25. During the last week in January hybrids ranged all the way from 25 cents to \$1. Mr. Rochrs has a fine lot of Ulrich Brunner, which seems the favorite among bright colored hybrids in New York.

At the Sanders orchid place at Summit Mr. Dimmock has the rare Laelia Pattinii alba in bloom. It is one of the white orchids which really is white; the adjective alba is very often tacked on a name when the plant has a merely partially white flower, but this Laelia is snowy. Some fine white lycopastes were seen at the same place; also very richly colored Cattleya Trianae. While noticing a good form of Oncidium splendens Mr. Dimmock spoke of its advantages over many of its family for cut bloom, as the entire spike usually opens within a week. Many oncidiums open so slowly that the lower blooms fade before the entire spike is opened.

The DeForest place at Summit seems to give an affirmative answer to the question whether it pays to grow orchids for cut flowers. There is a bewildering quantity of the plants to be seen, among them some very fine varieties. A great quantity of phalenopsis have been cut, these being favored for bridal bouquets. Cattleyas are grown in great profusion: one immense mass from this place has been attracting much admiration lately in Klunder's window. Fine spikes of Calanthe oculata gigantea formed another attractive sight; the calanthe is a good thing for cutting. At the same place was an unusually fine variety of Odontoglossum Harryanum; it was very large and very deeply colored.

Some roses are grown at Mr. DeForest's, but the orchid houses form the chief feature of the place, and it is quite remarkable to note the number satisfactory for cutting.

During the early part of February an orchid show will be held at the United States Nurseries, the entire place being decorated and arranged for exhibition, after the manner of previous shows. It is likely to be a most attractive show, judging from the interesting things now on the place.

Messrs. Siebrecht & Wadley will hold their fourth orchid show at the Eden Musee, beginning February 18 and lasting a week. A renewal of their former successes is anticipated; people look forward to seeing fine flowers and tasteful arrangements at their shows, and the expectation is not likely to be disappointed this year.

A very artistic arrangement in Thorley's window recently consisted of nothing but Roman hyacinths and acaenia; the gold and white flowers looked as if thrown down with apparent carelessness

which was the perfection of art, like a big trailing sheaf filling the window. It was daintily effective.

Many florists' windows are now arranged with potted ericas, covered with their pink bells; they are much admired when stood in a Leeds jar for room decoration.

Business through January has been really good; the flower crop has not been very large, as few growers are cutting to their full extent, but there has been little trouble in disposing of all the flowers that came in. Easter coming early this year gives the florists a better chance after Lent. EMILY LOUISE TAPLIN.

Boston Notes.

The cut flower trade in Boston has been brisk and well up to the average for the month of January. Prices of carnations and roses have kept steadily at good figures, and all kinds of "bulbous" flowers, especially those that are white, have sold exceedingly well. There are some very good Jacobs and Hybrids coming into the market now, but the prices on these rule low as compared with the prices of but a few years ago. Heath has begun to come in and is unusually good, the result in part of the favorable summer of 1889. Orchids seem to be more generally sought after than ever.

There have been some changes in the trade here recently, notably the relinquishing of their city store by Dee Bros., and the removal of N. S. Wax from his humble quarters on Park street to a little gem of a store on Winter street. Other changes are soon to occur if rumor is correct.

The Gardeners' and Florists' Club is thoroughly awake regarding the coming convention, particularly since the enthusiastic meeting here of the executive committee of the National Society. The Mass. Hort. Society is also quietly crystallizing plans for a superb exhibition next summer, which it is hoped will prove a great treat for the visitors.

The Boston brethren never allow business to engross them to such an extent as to neglect an opportunity for occasional social enjoyment and thoughtful provision for one another's comfort. One of the most enjoyable of their little excursions took place on Thursday evening, February 6, and took the form of a presentation to Mr. Jas. Rough at his residence, of a beautiful oak sideboard and an elegant easy chair. The occasion was a complete surprise to Mr. and Mrs. Rough, but they found eloquent words in which to express their thanks in response to the graceful presentation speech of Mr. Warren Ewell. There were about twenty prominent florists present who thoroughly appreciated the efforts of the orchestra and the caterer in their behalf. The sideboard was well stocked, i. e. at the time it was presented. But of course it needed just a slight replenishing after the boys had departed. W. J. S.

Washington.

The diplomats were out in all their glory the evening of January 21 at the dinner given by the President and Mrs. Harrison in their honor, and the East Room at the White House never looked lovelier than on this occasion. The decorators reached the height of floral art in the arrangement of the beautiful flowers and stately plants. The windows were filled in with tall palms and crotons. One mantel was banked with white azaleas and carnations, with a center-

piece of Marechal Niels and the whole filled in with sprays of hyacinths. The center figure in the right hand mantel was formed of brilliant Jacquemont roses and from each shelf hung a fringe of asparagus vines that fell over the brighter-leaved plants filling up the grates. At either end of the room was a huge mound of palms, rubber plants and poinsettias. The doorways were hung with strings of asparagus, looped back with garlands of flowers. The mirrors and chandeliers were draped with festoons of smilax, and when the brilliant light was thrown over all the effect was indescribably lovely.

In the Green Room there were jars of poinsettias and red tulips alternating on the mantels. The decorations in the Blue Room were more elaborate, and the windows were invisible behind the groups of large palms and vine hangings. On the mantels were primroses of every color, and mingled with them were delicate maidenhair ferns. The Red Room was touched up with jars of hyacinths on the mantels and pots of tulips in the windows.

The dining-room with its I-shaped table was a thing of beauty. In the decorations of the table the caterer and florist exhausted every detail of their arts, and produced a picture that is rarely seen. The centerpiece was a huge oblong mat of delicate orchids and mignonette. The foundation of mignonette was almost hidden under the lavish arrangement of orchids. At either end of the table was a hemisphere made of ivy leaves and carnations, the continents being outlined in flowers upon the green background. There were baskets of lily of the valley at the extreme side points of the table, and opposite these were baskets of Marechal Niels. On each plate lay the usual floral souvenirs. For the ladies there were bunches of brilliant orchids, looking like so many dainty butterflies, tied with white satin-edged corded ribbon. For the men there was a single orchid and fern for the button hole.

Scientific Education.

This has been talked about and written up considerably of late, and it is an excellent subject, which should be well considered by all, but it seems to me that few, so far, have entered into the facts of the case. We have already excellent schools, where a good general education can be obtained by all, independent of creed or nationality at a small cost individually. We had nothing of the sort in England when I was a boy, and when I began to learn the business at the age of 13, being taken from an excellent academy for that purpose, I was glad to buy all the books I could afford from my small pay, and employ all my leisure in studying what science I could in the small amount of time allowed. This was necessarily late at night, as we had to work long hours, including most of Sunday.

A youth in a public school, if he has ambition to pass a good examination, will have no time for such studies as botany, chemistry, geology, etc., which a florist should have some knowledge of because his numerous general studies will occupy him until bed time. These sciences appear in the public school course, but the knowledge gained is usually a mere smattering. Unless his friends can afford to give him a course at college he usually has to commence in some business at 14 or 15 to earn a portion of his living. If he has a few years at college it seldom improves his business qualities, that is if he has to start life and earn his own cap-

ital; he is much more likely to starve to death than a man who can shovel dirt or fire a locomotive.

As regards state assistance to found a scientific school and experimental garden it would be well for the supporters of this plan to read an article in a recent funny paper, in which a man of the present age is supposed to come back at Christmas, 1990, when the state has control of everything, down to the size and number of dolls to be given to the children. Of course this is very ridiculous, but scarcely more so than asking state aid for the purpose mentioned, which if granted would give all the cranks a precedent to ask aid for every kind of hobby. So long as there was any surplus in the treasury they would claim a share in the boodle, as well as the florists.

I give many of the supporters credit for their good intentions, but there is also a class of wind-bags who would claim and think they were worthy of filling all the paying places connected with such a project. None of the average legislators would support such a request for aid unless they saw a chance of sharing in its advantages. Mr. McGinty, who has district influence, would want places for his son, or a friend's son in any soft position there might be, while those for whom it was intended must be content with any trifle left after the politician's claims are filled.

I presume it is generally known that the National Botanic Garden would have no money voted, or would be cut down to such a small sum that it would be practically useless if the supply of cut flowers, etc. to the legislators' wives and friends was stopped. There were, or are (I presume it is not altered), houses for growing roses and other flowers for that purpose, which sounds queer for a so-called botanic garden. I do not blame the superintendent but the system, which I believe is carried out more or less in all the horticultural departments at Washington. I recollect the instance of one of our law makers, now dead, who had all his bedding plants, cut flowers and other things for decorating sent to his home, some 700 miles distant. The express companies would dead-head these things, and there being, no doubt, thousands of this kind of goods sent to various parts of the states, is it a wonder that the express companies charge double rates to florists for delivering plants, raise the rates for cut flowers and charge for returning empties? Florists have to help pay the tax to support a national garden, again for delivering the things grown there to the law makers, also in loss of business that might be had if there was no free department, and lastly in loss of custom through excessive express charges, which really come out of the florists' pocket, as his customers would buy more and oftener if the freight was reasonable.

If desirable, I may in a future article give a few notes on the working of Kew and Chiswick, which years ago I had the opportunities of learning, though I was never employed at either place.

Maywood, N. J. JAS. TAPLIN.

A Chrysanthemum Exhibit.

Our illustration is from a photograph showing a portion of the exhibit made by the National Chrysanthemum Society of England at the exhibition at the Royal Aquarium, Westminster, London, during the past chrysanthemum season. We are indebted to Mr. Wm. Mouttain, of the Royal Academy studios, London, for the photograph.

PART OF AN EXHIBIT BY THE NATIONAL CHRYSANTHEMUM SOCIETY OF ENGLAND AT THE ROYAL AQUARIUM

New Varieties.

BY A. E. WHITTLE.

In common with many other florists the writer is an enthusiastic admirer of enterprise, not only in all of life's pursuits, but especially so in the profession which is his means of livelihood, and the object of his ardent interest.

It is an undoubted fact that only by enterprise can any man hope to succeed. One who shows any lack of it is sure to be distanced by those whose efforts are characterized by energy and observation, put into judicious practice. And as we are all agreed that enterprise is the desideratum for every one it may not be amiss to inquire for a moment what enterprise means.

It must be generally conceded that enterprise can end in failure, for the word really means a bold attempt, and one may make many attempts, yet may also meet with repeated failures. For a man to carry his enterprise to a successful

conclusion he must combine other desirable qualities with his love of it, a judgment which will teach him only to undertake that which he feels he has the ability to perform.

There is an idea prevalent with some men that expenditure is enterprise. That he who spends lots of money and attempts many undertakings is the man to be styled enterprising. But unless this expenditure in business matters is calculated to bring an adequate return the enterprise is injudicious, and will soon bring the business to the verge of ruin. No man, in these days of excessive competition, can afford to be reckless in his expenditures. The expenditure of every cent must be watched, and only those expenses incurred which are absolutely necessary, or which promise to be a good investment, likely to return us with interest the money spent.

According to the words of Wm. Dallas, published in the *Florist* of January 1, the inference may be drawn that enterprise consists in the indiscriminate pur-

chase of new plants, for there he seems to make the statement that those who do so are more enterprising than those who are cautious in such expenditures.

From such a view the writer most emphatically dissents. Probably Mr. Dallas is such a man as his writing depicts. One who buys new plants, grows them, compares their various merits, for the benefit of his competitors. Thereby proving a benefactor to horticulture at large. If he finds such business methods pay it is right for him to pursue them. But many of us have neither the time nor the money to follow the course he so lucidly points out. We are in this business, not only because we love it, but essentially because we wish to make money; and to do so each and every one of us uses means according to the ability given. It may be that Mr. Dallas' way is more enterprising, and probably more remunerative than the one followed, but at present the conception is utterly at variance with any such theory. I am quite content to waive the role of public benefactor which

he so kindly suggests to me, and leave to Mr. Dallas, who recommends the part, all the honors likely to accrue from such a position.

It is safe to assume that there is no florist, unless taught by years of experience, who does not purchase more new varieties than the profits warrant, that are obtained from the propagation, cultivation and sale of these new varieties. A distinction must here be made between florists who do a catalogue business and those who grow for the sale of cut flowers. Men who catalogue the varieties they buy and who invariably print the raiser's, or some other highly colored description, can afford to purchase everything that is sent out, for they depend for their returns upon the young plants of these varieties that are sold; in very many cases quite extensively.

But it is to those of us not so situated that this criticism applies. Those of us who do no catalogue business—who sell no young plants other than of varieties generally known, can not afford to obtain a title of the new plants sent out. Such a proceeding is unwise in every respect. "Oh," but say some of our friends. "Here is room for enterprise. Such expenditure partakes of a speculation. Buy largely and you may reap largely." Very well. Those who wish to can, but I for one am willing to leave this expense to my more enterprising brethren.

A case or two in point. Will some florist kindly tell us what rose we should discard to make room for "Souvenir de Wootton." Here is a rose of which the most glowing descriptions are given. According to these descriptions we have at last the *ne plus ultra* of red roses. We have been waiting for this rose for years. It is just what we need, and therefore we will throw out all our other red roses and invest largely in "Souvenir de Wootton." Where is the florist depending entirely upon the sales of his cut roses for the success of his business who would not gladly expend \$100 to \$200 to procure a red rose of good color, form and substance and of constant free flowering quality. But shall we gain this red rose by purchasing "Souvenir de Wootton?"

Last year the chrysanthemum "Mrs. Andrew Carnegie" was offered to the trade at \$2 per plant. At such a price one might expect to obtain something wonderful in the way of chrysanthemums. But probably those who paid out any large amount for this chrysanthemum regret their enterprise, for it is doubtful if the sale of the flowers, or even the plants of this variety will ever repay those who invested in this purchase.

Again this year numbers of new chrysanthemums are offered for sale at \$1 for each plant. Are these all better than the best we now have? No one would pretend to say so. Are they all as good as the best we have? Again the answer must be "No." But we are told that it is enterprise to buy them all in order to find out for ourselves what are really good and what are nothing but rubbish. How such uneconomical proceedings can be recommended to the general florist as good business methods is a mystery. For there is no florist, unless he has a large catalogue trade, who can pay \$1 each for plants of chrysanthemums or roses and expect to make any money out of the transaction.

It need not be supposed that this is an attempt to condemn as foolish the purchase of new plants. Varieties of decided advance in merit are offered from year to year. But it is this idea that is wrong, that because a plant is new it must therefore be better than that which is old.

Probably three fourths of the new varieties of plants grown by florists for the cut flower trade are not in demand for more than a year or two. It is useless to trust to catalogue descriptions. They are too highly painted. If a new variety is good time soon establishes its value. The large growers soon know its merits, and propagate in such large quantities that the price is quickly placed within reach of all.

For the reasons above adduced the writer can not agree that it is judicious enterprise to purchase new plants indiscriminately, no matter how glowing may be the first praise. It is commonly the practice by the general florist to purchase a few of a new rose etc. at its first distribution, and expect that a stock can be raised from these few plants and money be saved by so doing. But it is never so. By the time the stocks raised the market is flooded with stock of this variety at a much reduced rate.

Neither can the merits of a rose be ascertained by growing one or two dozen plants. To treat a rose fairly it should have a bench all to itself. Therefore experience teaches that the majority of florists are not pecuniarily benefited by the purchase of new varieties until popular report establishes the merits of any variety.

Nomenclature.

A private and personal letter to the reader:

DEAR SIR.—You have doubtless read in the FLORIST sundry articles criticising the nomenclature committee. Very likely you have criticised it yourself either in word or in thought, and shaken your head and wondered why it was that in all this time there was no evidence that anything had been accomplished. You have noticed that a request has been made of the public at large that they send in such cases of mis-nomenclature as have come under their observation and have again wondered that there was no response to this appeal.

Now allow me to ask you confidentially—What have you done? You doubtless know of some plants that have been mis-named and re-named, but it apparently has not occurred to you that you had any individual responsibility in the matter and that it was your duty to make a memorandum of these cases and send it in to aid the committee in their work. It is your duty, however, and unless you do your duty the work must necessarily lag. We may get the very best men in the society on the committee and we may get old nomenclature himself for chairman and still the results will be comparatively meager if these men have for data only the results of their own personal observations.

The committee are ready and willing to work, but they must have help in collecting the material to work on.

Will you not render your share of this assistance? Do not put the matter off, but draw up to your writing desk and right now make out a list of synonyms known to you and send it in, either to the chairman of one of the sub-committees or, if you prefer, to the AM. FLORIST for publication in this column. Cases about which there is possible doubt might be published here to great advantage, as discussion would be drawn out and disputed questions perhaps settled better than the committee could possibly settle them. The rectification of our nomenclature is a large work, a work demanding the united wisdom of the entire florist guild, and if it is to be successfully accom-

plished you and every one must "bear a hand" and make what contribution you can to the general fund of facts.

Very truly yours, JAS. D. RAYNOLDS.

Request for Assistance from the Experiment Stations.

Copies of the following letter have been mailed to the Directors of the various Agricultural Experiment Stations:

The Society of American Florists has appointed a standing committee, a part of whose work it is to ascertain all cases possible where the same plant appears under two or more names in the catalogues of different dealers, and to take measures so far as they can to determine and publish the true and original names.

It has been asserted that many cases of renaming have been with fraudulent intent by dealers who send out old plants as novelties, or deliberately re-christen other people's novelties and send them out as their own.

This makes our task one of peculiar delicacy. It behooves us to be extremely cautious in promulgating any dictum which may carry with it the implication that any issuer of a catalogue has been guilty of attempted fraud. We must be very sure we are right before proclaiming that any plant is not entitled to the name under which it is advertised, and the only way to obtain this certitude would seem to be the buying from different dealers of specimens of varieties suspected of being identical and growing them side by side for a year or two till positive knowledge can be obtained. The Society of American Florists has neither the money nor facilities for doing this work, but the Agricultural Experiment Stations have both, and we feel that as a not insignificant portion of the great agricultural population we are entitled to a share of the benefits accruing under the Hatch appropriation bill, that we are entitled to ask of the Experiment Stations that they help us in carrying out this work—a work which we deem of great public importance as looking to the protection from imposition of the small buyers all over the country who have at present no means of knowing whether they are being imposed upon by the representations made in catalogues sent them by plant growers and seedsmen.

The nomenclature committee are to meet in Boston August next, and between now and then will be individually engaged in collecting needful data. When they meet lists will be made out of plants which should be grown by some one competent to establish their identity. We then propose to ask the Experiment Stations to take up the work and carry it on to conclusion. I desire to know from you whether you consider it in the line of your duty to undertake any portion of this work—whether you have present facilities for so doing and if so whether there is any particular class of florists' plants which your gardeners are specially qualified to handle. I am,

Very respectfully,

JAS. D. RAYNOLDS.

Chairman Com. on Nomenclature S. A. F.
Riverside, Ill., Feb. 6, '90.

LINUM TRIGYNUM (Reinwardtia trigyna).—What a beautiful little yellow flowering plant this is for winter, so showy and so profuse that even the cuttings in the propagating beds keep in bloom. But although copiously produced the individual flowers are ephemeral, hence useless for cutting. As a house or greenhouse decorative plant, however, it is useful and very pleasing to amateurs. W. F.

Seasonable Notes.

BY JOHN THORPE.

It will soon be time to buckle on the armor again in earnest; as the days get longer and the sun stronger greater activity is noticed day by day in the growth of the plants. If good cuttings are ready this is the time to begin to shape for specimen plants. I have found for the past five years the middle of February to be early enough. In making selections for specimen plants there should be good judgment used. I frequently notice that little care is given to this important point; for instance, without any information or idea of what the novelties are they are as a rule run into the race only to bring disappointment.

A chrysanthemum to be perfect for specimen plants wants every virtue and no failings. First, a healthy and sturdy habit of growth. Second, the foliage must be thick, heavy and profuse. Third, the flowers must be borne on strong foot-stalks, the shorter the better, so long as the flowers are held clear of the foliage. Fourth, the flowers must be bold, characteristic and expressive; not necessarily of the largest size, but they should be of even or about even size, showing good cultivation.

As to varieties, they must be distinct; they must wear well, that is they should keep in good condition for at least three weeks.

I append a list embracing a fine selection of colors, all of which have pretty nearly the points required. In starting plants for specimens I advise to begin with not less than three of each variety, and of such kinds as Cullingfordi, Mrs. Bowen, Wm. Stevens and Wm. Barr, start 6, retaining two or three of the best to the last, remembering that distinctness carries weight in a group of 25 or 26. In most competitions yellow and white predominate. As there is less difference in effect in these two colors than among the parti or mixed shades it should be borne in mind.

Chrysanthemum Inodorum Plenissimum.

I came across this plant in a prominent florist's greenhouse the other day, it had been sent to him as a new plant. But it isn't new by any means. It has been hawked around in florists' and seedsmen's

catalogues for many a day. This doesn't make it any the worse however, for it is a neat and free growing and copious little plant well worth growing in anybody's garden. I saw it in nice condition in editor Long's garden at Buffalo last August. It may be raised from seed or from cuttings. As is the case with most double flowers so it is with this, we often get inferior forms from seed, better propagate it from cuttings. And raise a fresh stock from cuttings every fall, for it does not live well over winter; this is not owing to tenderness, however, but rather to its somewhat annual nature.

Burning Sod.

This used to be, and probably is yet, done in many parts of England, although perhaps not so extensively as formerly, for the reason that there is not so much waste poor land available for the pur-

CHRYSANTHEMUM INODORUM PLENISSIMUM.

pose. The land was pared and burned somewhat in the way referred to by your correspondent, as seen by him in Bohemia. Much of this land only grew a scant herbage of short grass, with patches of wild thyme, gorse and juniper, on which sheep were pastured. This was burnt entirely to ashes, and spread on the land as a manure for barley and clover. It is one of the best manures for the latter, so much so that on apparently barren land it will produce an excellent crop. The effect on crops is said to last about two years.

The effect and value, however, depend much on the variety of soil; in the cases which came under my observation it was on land which, according to analysis of the ashes, would give the best results; that is, a stiff soil underlain by chalk. The result of an analysis by Sir Humphrey Davy gave from 200 grains this result: carbonate of lime 80 grains, gypsum 11 grains, charcoal 9 grains, saline matters, probably sulphate of potash and muriate of magnesia, 3 grains, oxide of iron 15 grains, insoluble earthy matter 82 grains, this being principally silica and alumina.

Another sample from a different soil and location, composed of three-fourths sand and containing a very small percentage of chalk: sand, clay and chalk 82 per cent, oxide of iron 9, charcoal 6, saline matter 3, chiefly common salt, and sulphate of potash.

A third sample from a strong clay soil contained 81 per cent of clay and sand, 2

of chalk, 7 of oxide of iron, 8 of charcoal and 2 of common salt and other saline matter. No doubt samples from the same localities would vary somewhat, and also from the same heap, but either burned or charred soil from sandy ground would be of less value in either case.

It would take too much space for a magazine to go into the details of burning other soils for ashes, and also the burning of clay from foundations or ditches for ballast, which was much done on the north side of London, and in other places, and also to some extent for fruit tree borders, where the subsoil was burnt and mixed with the stiff surface soil with good results.

Charring soil for general florist and gardening purposes is excellent where only a stiff cold sod is available, and although I look upon it more in a mechanical light than as improving the fertility, no doubt when burnt to ashes some fertilizing particles were made available which would not be in the raw state. It also made an excellent absorber and deodorizer for manure, both liquid and solid, never became sour or waterlogged, and plants generally made a more free and fibrous root than in soil usually available. I burned and used many hundred loads while at Chatsworth, having a very heavy cold clay soil above limestone. After the fibre was decayed and it became wet it was of the substance of brick clay, but after it was burned and the ashes and particles of charcoal mixed with it continued in a good friable condition.

I had abundance of waste wood from pruning and thinning trees, shrubs, etc. With this I made a good fire, and when a strong body of fire was obtained the sods were placed on it a single sod thick, and when thoroughly heated turned over to expose all parts to action of fire and thoroughly heat it through. This charred the outside and killed all insects and their eggs. A handy man with a fork and plenty of rough wood will char a large heap in a day, but from the large quantity I required it occupied some weeks. All the ashes and charcoal was thoroughly mixed with the manure added when the soil was used. We had several large tanks attached to water closets, which were pumped out and mixed with the heap for surfacing fruit borders, planting pine apples, etc., and the results were excellent.

Although I had adopted this plan previously on a moderate scale I carried it out so extensively on the advice of Sir Joseph Paxton, who told me he had found it necessary with the soil there, and he attributed the partial, and in some cases, entire failure of certain crops to neglect in using the soil without burning. We used also to keep a fire burning on the rubbish ground, which when once well started would keep in for an indefinite time, and not only consume all small prunings, but char and kill seeds of weeds and insects, and make an excellent manure also.

THE YELLOW IPOMEEA.—In a note, page 138, November 1 last, I referred to the shy blooming nature of this vine, in fact, I had not then seen it in bloom. But the other day a prominent florist exultingly pointed it out to me in his greenhouse in bloom (he had that instant only caught sight of it himself) and spread himself upon its merits. "Stop now," I said, "let me ask you a question. Is this the first flower of it you have ever seen?" "It is not," he answered. "Well then,

have you, before now, seen more than two blooms of it?" I asked. "I don't know that I have," he replied. At the same time I must not be too severe upon it, for I know too little about it. The flower was nearly two inches wide and of a real good yellow color, showy and decided, and borne on a rooted cutting in a 3-inch pot. He calls it *Ipomæa aurea*, but I have no means of verifying this name.

Oncidium Splendendum.

Nearly thirty years have elapsed since this plant found its home in European gardens and was (until the last three years) extremely rare and only met with in select collections. Ever since its introduction many attempts have been made to rediscover its native home, and in 1887 it again made its appearance in the imported state and is now so widely distributed that few collections of orchids are seen without it. It is a vigorous grower and very distinct in habit; it is (when out of flower) sometimes confounded with *O. microchilum*, a plant similar in growth, its bulbs, however, are more pointed than *O. splendendum* and its foliage narrower; its flowers also are entirely different, being very small and arranged on a long many branched stem.

O. splendendum is easily recognized by its broad, blunt pseudo-bulbs which bear a bold thick leaf of leathery like texture, from the base of which the strong erect stems measuring $2\frac{1}{2}$ to 3 feet make their appearance. During the months of December and January the flowers expand, which renders it very valuable both for cutting and decorative purposes. The stems are well branched and often carry twenty to thirty large blossoms, each having a broad brilliant yellow lip measuring $\frac{1}{2}$ to 2 inches across, the sepals and petals are also yellow, heavily barred and spotted with purplish brown; at a glance they very much resemble *O. tigrinum*, but when compared will be found much richer in color and the formation quite distinct, the flowers expand easier than *O. tigrinum*; few days elapse from the time the flowers at the base of the stems make their appearance until all are fully developed.

It can be cultivated very easily, enjoying a position where ample light is available, especially during their growing season, baskets and blocks are most preferable, and when growth is completed place a very few degrees cooler to enable it to thoroughly mature before it commences to bloom, afterwards it may be removed to its former position in a temperature of 60° to 65° , when the spikes will appear and the blossoms remain in perfection for several weeks.
